

25

**THIS YEAR OUR COMPANY
CELEBRATES ITS 25TH ANNIVERSARY.
WHAT HAVE WE ACHIEVED?**

#1 GLOBALLY in terms of FSC certified forest area

3,2 MILLION TONS of P&P products per annum

\$2 BILLION invested over the last 5 years

Sales to more than **70 COUNTRIES**

Ilim Group is the largest pulp and paper company in Russia. We always strive to be the best in all key business segments, while remaining one of the most profitable companies in the industry. Our strategy is in the process of constant renewal, which allows us to always look ahead and conduct our business guided by both the current situation and the vision of the future. This helps us to maintain the leading position and grow further!

PRESENTATION OF RUSSIAN BIOFUEL AND SAWN TIMBER MANUFACTURERS

MAY 24TH 2017,
14.00-17.30
HANNOVER
MESSE LAATZEN,
HALL 26

"Presentation of Russian Biofuel and Sawn Timber Manufacturers" is a unique event which takes place for the first time. Speakers of the Conference – Russian companies – exporters of pellets, sawn timber and woodworking equipment.

Participants of the Event are representatives of energy, construction and trading companies of Europe.

Key topics of the conference:

- Bioenergy industry of Russia – growing points and possibilities for cooperation
- Presentations of Russian manufacturers of pellets, briquettes and other types of biofuel
- Sawmilling industry of Russia – perspectives of cooperation
- Presentation of sawn timber manufacturers

We invite all concerned companies who are interested in partners from Russia to take part in the Event. Growing Russian timber industry is ready to offer high quality products worldwide. Good logistics infrastructure, favorable currency exchange rate makes Russian products competitive from Europe till Far East.

Conference language – Russian, English.

PROGRAMM OF THE PRESENTATION

MAY 24TH 2017,
14.00-17.30
HANNOVER
MESSE LAATZEN,
HALL 26

Moderator: director IAA Infobio, chief editor of the BioEnergy International magazine Olga Rakitova

Time	Topics	Speakers
14.00 – 14.10	Opening the conference. Introduction of moderator.	
14.10 – 14.40	Bio-energetics of Russia: growth points and opportunities for cooperation	Infobio Olga Rakitova, Director
14.40 – 15.10	Production of coal briquettes from timber industry wastes	Wood technological company (Shelekhovsky DOZ) Alexander Pekarets, Director
15.10 – 15.30	Ustyansky Timber Industry Complex: ambitious plans of development	Ustyansky Timber Industry Complex Tatyana Zenina, Deputy director for finances and economy
15.30 – 15.50	Perspective growth points of timber industry of Sverdlovsk region	Development corporation of Sverdlovsk region Ilya Pachkay, Project director
15.50 – 16.20	Production and biofuel export from Russia: first biofuel terminal – opportunities for Russia and Europe	First St-Petersburg biofuel terminal Andrey Tikhomirov, Director
16.20 – 16.35	Sawmilling industry of Russia: estimated capacities, competitive capacities and markets	WhatWood Kirill Baranov, Chief editor
16.35 – 16.50	Presentation of timber industry of Kirov region and opportunities for investors	Center of export promotion of Kirov region Alexey Shuleptsov, Director
16.50 – 17.20	Summary and discussions	

Conference audience: representatives of European energy, construction and trading companies, which import biofuel and sawn timber (traders, purchasing departments), woodworkers, relevant associations and authorities.

Conference language – Russian, English. Participation in the conference for fee. Russian companies are invited as speakers.

The Russian forest industry in 2016–2017: domestic market “jumps on the bottom”, exporters are happy but nervous

In 2016, the Russian forest industry exceeded 12 bln USD (commodities only), which was app. 1% of the GDP of Russia. Total export of forest industry commodity products was over 7 bln USD, 2.4% of total Russian export. After sharp devaluation of RUB at the end of 2014, the situation develops pretty much in line with the foreseen path: export-oriented businesses thrive (sawn wood, plywood, pellets, pulp) while domestic-oriented businesses suffer (PB, FB, OSB, housing, some paper grades).

MACROECONOMIC SITUATION: “jumping on the bottom”

One of our clients phrased it nicely that “Russian economy is jumping on the bottom”. And it really is. After sharp decline of GDP in 2015 (-2.8%) and further decline in 2016 (-0.2%), the question is, if we are at the bottom yet? Official Russian statistics is positive – and not only about the future: recently the 2015 numbers were corrected to the better for 2015 (from -3.6% drop to -2.8% drop), as well as for 2016 first estimations (from -0.8% to -0.2%). The reasoning behind such corrections is still a bit unclear as quarterly figures in 2016 do not support the final estimation.

At least a part of the reasoning is that Russia is switching to more internationally applied methodology in calculating the GDP where (among other things) GDP includes rent of dwelling owners “renting” their own apartments “from themselves for themselves”. That gives a one-time boost to the numbers. However, this part would explain only some 0.1-0.2% difference.

Let's have a look at other macroeconomic indicators: capital expenditures, manufacturing, construction, and retail. Capital expenditures in 2016 are estimated to drop by -0.9% compared to 2015 (-10.1% in 2015 compared to 2014). Retail is equally troubling, with -8.8% drop in 2015, followed by further drop of -3.1% in 2016. Manufacturing is back to black numbers already: increase of +1.1% in 2016 (after -4.6% in 2015), which is definitely a positive sign.

Taking 2004 as a basis (2004=100%), the cumulative development of those indicators in 2004–2016 is shown on Fig. 2. Assuming the development of GDP in 2017–2021 as presented in World Economic Outlook by IMF in January 2017 (Fig. 3), and making other indicators follow the proportion set by the corresponding averages in 2004–2016, we get the forecasts for those indicators as a cumulative change (Fig. 2). Looking at Fig. 2, we see that – quite predictably – all the indicators follow a nice slide-and-climb pattern, with the climb back-to-2014 level completed by about 2020. The only exception here is retail volume, which is likely to take even longer than 2020 to surpass the local maximum of 2014.

Russian development in the context of the global economy is shown on Fig. 3: GDP in Top-25 countries globally (by GDP in 2014, not PPP-adjusted, alphabetically). Selected (ex-) CIS countries are shown as well, to complete the what-is-important picture.

The changes are given as cumulative results with 2014 as a basis (2014=100%). We can see that, in the global context, Russian numbers for 2017–2021 do not look impressive – far behind even the global averages. The forecasts for Ukraine and Belarus are even gloomier.

There is one more indicator I would like to show in this context: a very simple, intuitively understandable, reliable and readily available on a monthly basis. It will be relevant to the forest industry as well. The indicator is sales of personal cars. If you are surprised to see it here, let me explain: sales of personal cars often “fight” for the same family budgets as renovation and new furniture. Volume-wise, the correlation between personal car sales, renovation and furniture sales is not that strong while the general pattern “are we back to growth yet?” is definitely applicable to all of those sectors. And renovation as a sector is more important in Russia in terms of volume of forest industry products consumption than e.g. new residential housing. Thus, let's have a closer look.

Figures 2–4 present a nice set of data to compare the 2009 crisis in Russia with the 2015–2016 crisis:

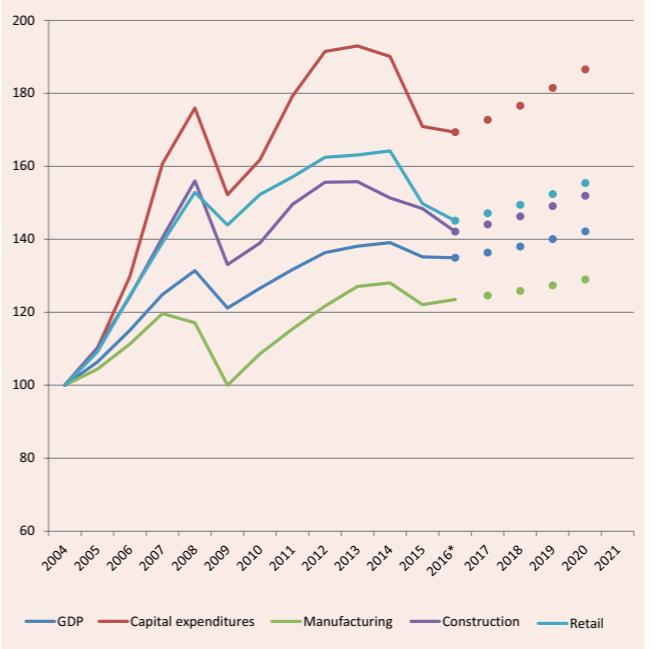

- The current crisis is longer – for Russia so far it is at least twice as long as the 2009 crisis
- The current crisis is local, the only other countries seriously affected by it are the countries hugely dependent on political and economic situation in Russia
- This time the domestic production was hit much less than in 2009 (mostly due to the RUB devaluation at the end of 2014 which led to less import and larger export)
- And retail was/is hit much harder, it is the only indicator in our set with 2016 level virtually equal to the 2009 level

Fig. 1. Development of main macroeconomic indicators in Russia in 2004–2016 in constant prices, per cent to the previous year

	GDP	Capital expenditures	Manufacturing*	Construction	Retail
2004	7.2	11.8	8.1	9.9	10.2
2005	6.4	10.2	4.4	10.2	9.1
2006	8.2	17.8	6.6	12.8	14.1
2007	8.5	23.8	7.5	13.0	11.7
2008	5.2	9.5	-2.1	11.1	9.9
2009	-7.8	-13.5	-14.6	-14.7	-5.8
2010	4.5	6.3	8.6	4.4	5.8
2011	4.0	10.8	6.3	7.6	3.2
2012	3.5	6.8	5.4	4.0	3.4
2013	1.3	0.8	4.4	0.1	0.4
2014	0.7	-1.5	0.8	-2.8	0.7
2015	-2.8	-10.1	-4.6	-1.9	-8.8
2016*	-0.2	-0.9	1.1	-4.2	-3.1
Average in 2004–2016	3.0	5.5	2.5	3.8	3.9
Increase corresponding to 1% GDP increase		1.9	0.8	1.3	1.3
Correlation to GDP, per capita		0.96	0.86	0.97	0.93

* Manufacturing excludes mining and production of energy

Fig. 2. Development of main macroeconomic indicators in Russia with forecast, 2004–2021, cumulative changes, 2004=100%

The graph on Fig. 4 contains the answer to the question “are we back to growth yet?” – the answer is “no”. Sales of personal cars back to the level of at least 150-200 thousand units per month would mean that the consumption is back to the “moderately healthy” level, but we are not yet there, and the trend is still unclear. Note that the last point on the graph is March 2017.

A similar dynamic to the car sales (with much fewer extremes, however) was seen in furniture consumption and in home improvement and renovation activity recently. Furniture consumption naturally supports domestic furniture production and thus the level of demand for particleboard, plywood and MDF, while renovation activity supports demand mainly for OSB, HDF (in the form of laminate flooring consumption) and plywood.

We cannot ignore one more important macro-indicator: new construction and its main part in Russia, new residential housing.

In 2014, the increase in new residential housing was staggering: up by nearly 30 per cent in the first half of the year and some 15 per cent by the year's end (measured in m²). The 2015 numbers were equally high, followed by decline in 2016 and potentially even larger decline in 2017. The numbers on the graph on Fig. 5 show decline of nearly 20% for 2017 in total residential housing and even more significant decline of over 30% in low rise housing. Those numbers are based on Jan-Feb 2017 statistics compared to Jan-Feb 2016 numbers. The year-end results might be better due to more positive dynamics later in 2017.

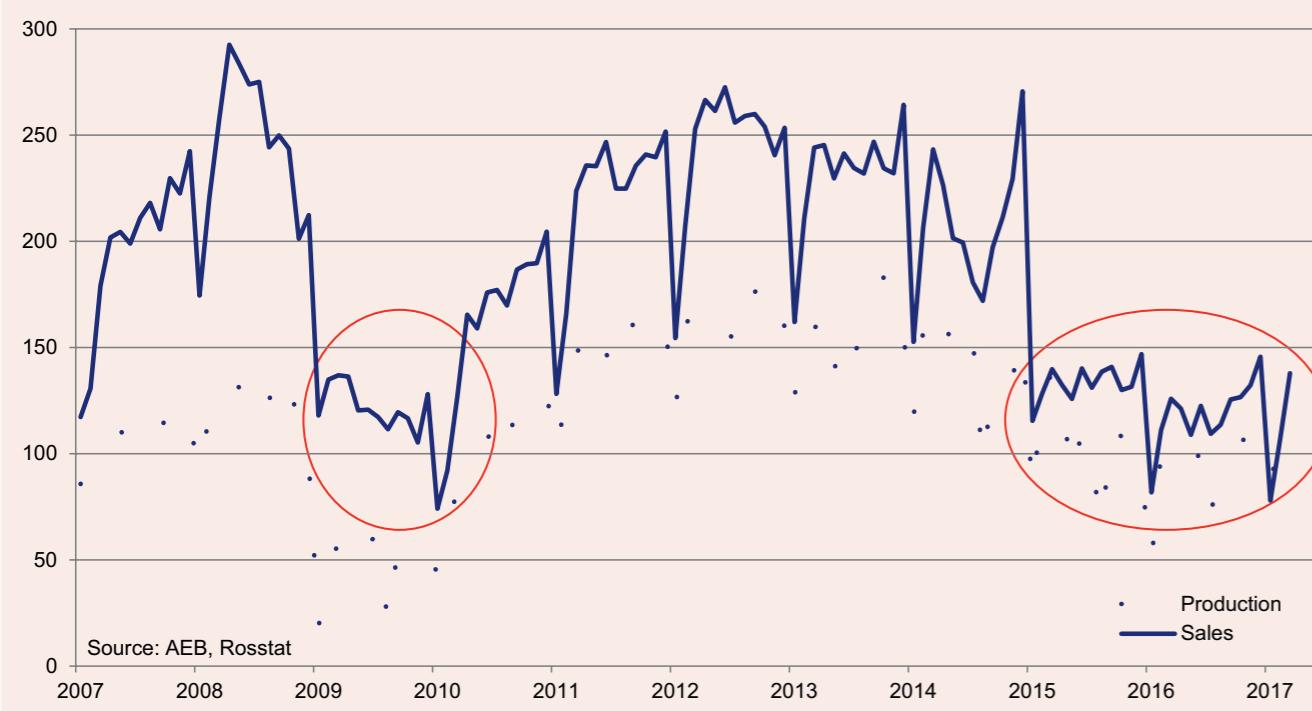

The overall pattern is similar to the 2009 crisis: there is a lag between the “housing crisis” (in physical volume) and the “retail crisis”. The lag can be explained by an urge to finish current projects at the beginning of the crisis

Fig. 3. GDP development in 2014–2021 in Top-25 economies in the world and selected neighboring countries, cumulative changes, 2014=100%

* 2015 and 2016 numbers from Russian Statistics

Fig. 4. Production and sales of personal cars in Russia, 2007–2016, 1000 cars per month

(causing a hike) while there is much smaller interest to start new projects (causing decline potentially longer than the crisis itself).

In 2014–2016, Russia showed the volumes consistently higher than its previous USSR record level (set in 1987) by new residential housing area: 72.8 mln m²/a. However, the volume in 2017 might go back to under 70 mln m²/a, based on the Jan-Feb statistics.

In 2016, new residential housing was responsible for nearly 80% of total new buildings construction in Russia by area: 102.9 mln m²/a in residential housing (including non-living space) vs. 131.5 mln m²/a of total area in newly constructed buildings. Commercial area represented some 7% of the total. Administrative, educational and healthcare buildings represented some 1.5% of the total. Most of the rest were industrial and agricultural buildings (3.5% of the total).

Brick remains the most popular material in new residential housing: 33.6% in 2015. However, a share of brick construction is declining at a rate of some 1.7 percentage points per year. The fastest growing segment is monolithic (formwork) construction, it had a share of 16.3% in total new residential housing in 2015, and the share grew by an average of some 0.9 percentage points per year in 2010–2015. A share of wood-based construction was declining: 11.6% in 2010; 9.7% in 2015; average decline rate of –0.4% per year. Partly (as in case of brick-based residential housing) the latter might be explained by overall declining share of low-rise housing in recent years: from 43.7% share in 2010 down to 39.6% share in 2016. High-rise wood-based housing in Russia is basically non-existent, the permitting process works “on individual basis” with only a few projects so far.

Over 75% of total new residential housing and over 80% of new individual (low-rise) housing is built in Western Russia, i.e. all of Russia excluding the

Siberian, Ural and Far East Federal Regions. The share of construction in given regions across the country is relatively stable year-to-year, and the concentration of demand in Western Russia dictates the location of new production facilities focused on the domestic market.

SETUP FOR EXPORTERS: it is hard to complain

Going from domestic to the export oriented business, we can see a much brighter picture. And the only reason for that is the exchange rate. At the end of 2014, competitiveness of Russian (as well as Belorussian/Ukrainian) export oriented producers grew roughly twice against their European, North American, and Chinese counterparts, based on the exchange rate alone (Fig. 6). In 2017, we saw a moderate strengthening of RUB while the overall picture remained unchanged: export oriented production enjoyed additional benefits due to RUB devaluation. A boost of the export markets attractiveness for Russian producers led to some cases of oversupply at key export destinations and as a consequence to the pressure on prices. However, neither fall in prices, nor some increase in raw material cost in CIS (in local currencies) even came close to negate the positive effect of the weakening RUB for exporters.

The future of the exchange rate development mostly depends on development of oil prices. Since 2H2011, RUB to USD exchange rate follows almost exactly the development of oil price. In a simple case, the correlation might be shown as a see-saw with the pivot at 57 RUB/USD (nominal) and 57 USD/barrel (Brent). When the oil price goes up, the RUB strengthens and vice versa, 1:1.

A bit more elaborate correlation is shown on Fig. 7: RUB/USD vs. Brent oil price, weekly: each point on the graph is one week, average price of oil vs. average RUB/USD exchange rate, nominal. So if you are reading this with a question in mind “for how long will Russians be able to dump their products

Fig. 5. New residential housing in Russia, million m²/year, 1987–2017

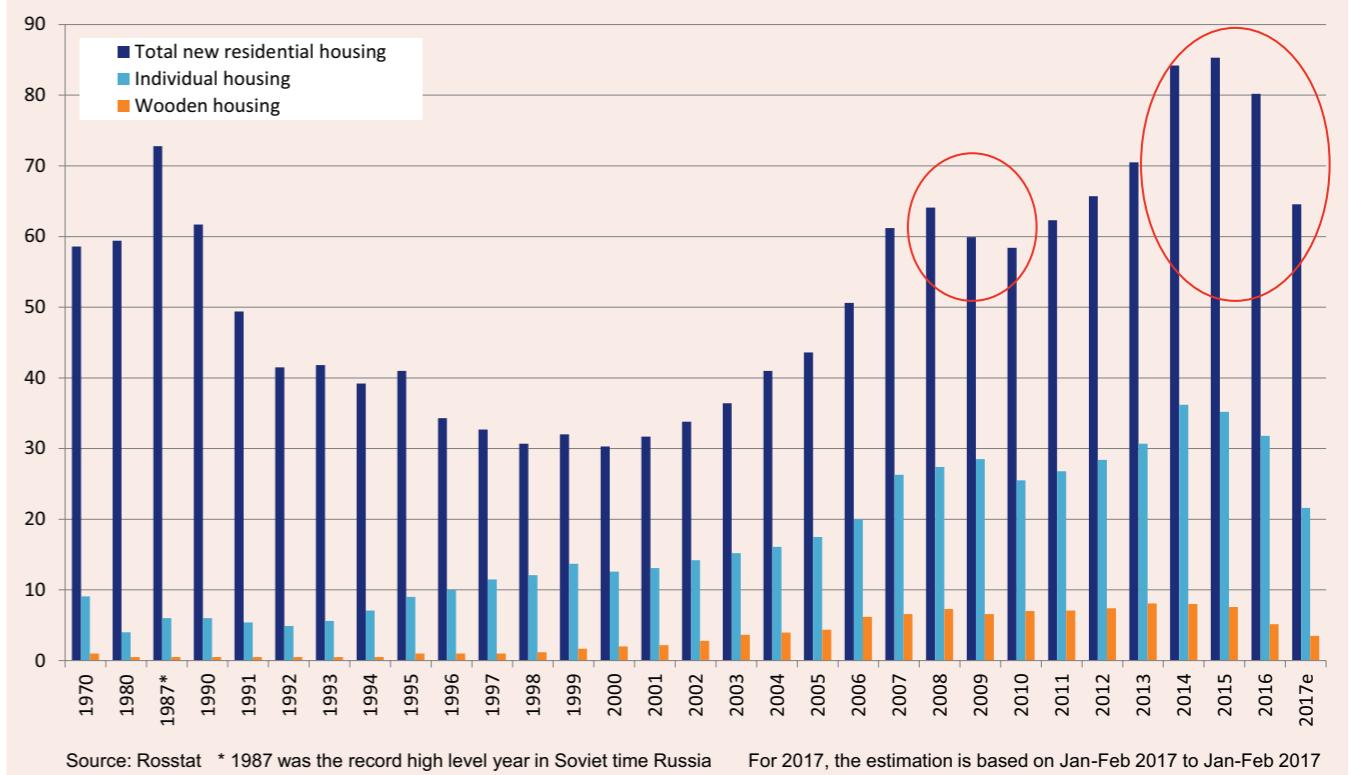

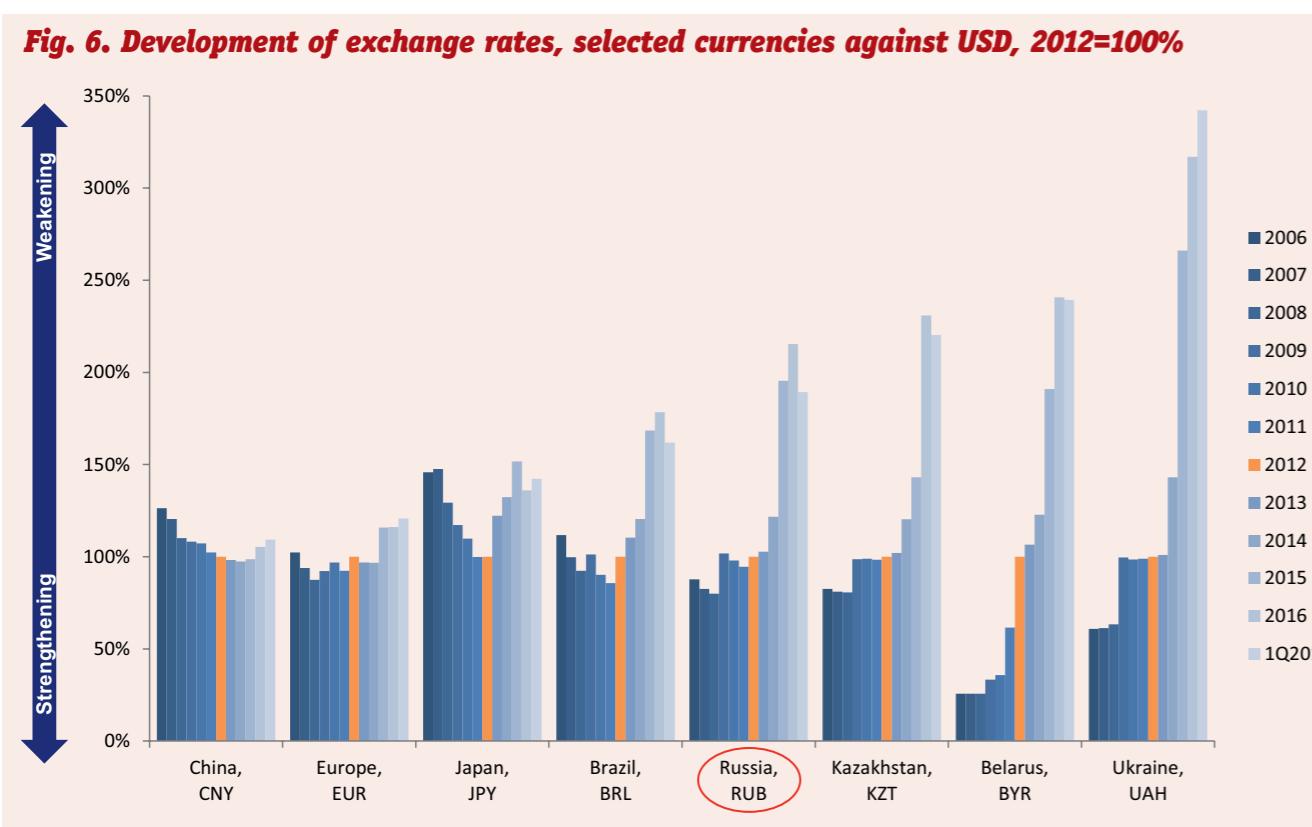

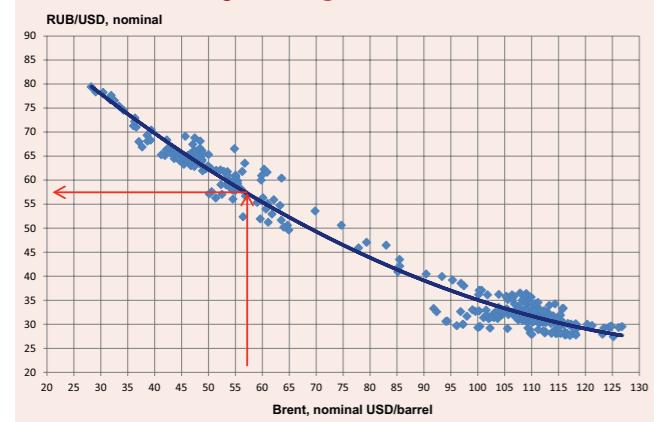

Fig. 6. Development of exchange rates, selected currencies against USD, 2012=100%

to the EU market at such low prices?!. You just need to ask yourself what oil price you believe will be in coming years. As long as it is below 60 USD/barrel, Russian exporters are pretty comfortable.

The correlation of the exchange rate with the oil prices might be broken by a number of events, e.g. aggressive selling or buying of RUB by the Russian Central Bank (and sometimes even a promise of that); change in legislation (e.g. in legislation regarding operations with foreign currency); military conflicts around Russia; larger/smaller sanctions against Russia; large scale improvement of investment climate in Russia; large scale political instability of any kind. The list is, of course, incomplete. And, undoubtedly, there are no clear rules and no clear forecasts – the level of unpredictability in and around Russia remains high.

Fig. 7: Correlation between RUB/USD exchange rate and Brent oil price, 2H2011-2017, nominal, weekly averages and a trend line

Physical volume of the export of the key exported forest industry products grew in 2014–2016 for most of the products: sawn wood and plywood export grew by 25% in 2016 compared to 2014, export of pulp grew by 14% in the same period, export of pellets grew by 22%. Only for two products in our Top-6 group we saw a decline: export of round wood remained almost unchanged (−4% in 2016 compared to 2014); and export of newsprint went down by −10% (Fig. 10).

On the other hand, prices per unit went down all across the board both in 2015 compared to 2014 and in 2016 compared to 2015. The only exception here was the price of pellets, which went up in 2015 before dropping again. Prices of roundwood went down by 21% in 2016 vs. 2014 (in nominal USD), sawnwood prices lost 32% (!) in the same period. Plywood prices went down by staggering 35% (however, in case of plywood it can partly be explained by slightly larger share of less expensive 5x5 plywood in the total mix). Prices of newsprint went down by 24%. Pulp prices lost 16%. Pellet prices lost 13% in 2016 compared to 2014, but in comparison of 2016 with 2015 the decline was much more noticeable: drop of 34% (!). Note that the prices here are given “as reported”, i.e. they are nominal and they include a range of delivery terms from EXW to DDP. However, in reality the average prices lie between FCA mill and FCA border (all delivery terms are given acc. to Incoterms 2010) and are consistent enough from year to year to make the direct comparison.

HOW BIG IS THE RUSSIAN FOREST INDUSTRY?

Have a look at a nice-and-friendly chart at Fig. 11 (yes, nice and friendly). The chart represents Russian forest industry in the whole, and so far we discussed the grey and the dark blue color coded products/boxes: main export oriented products and main products important both for export and for the domestic use respectively.

Now we move to domestic production: and all color-coded products are now important for the discussion. In simple terms, important means

Fig. 8. Position of key export products in the Russian forest industry among other Russian exports, 2014–2016

RUSSIAN FOREST INDUSTRY AT A GLANCE, 2017

Source: Pöyry Management Consulting

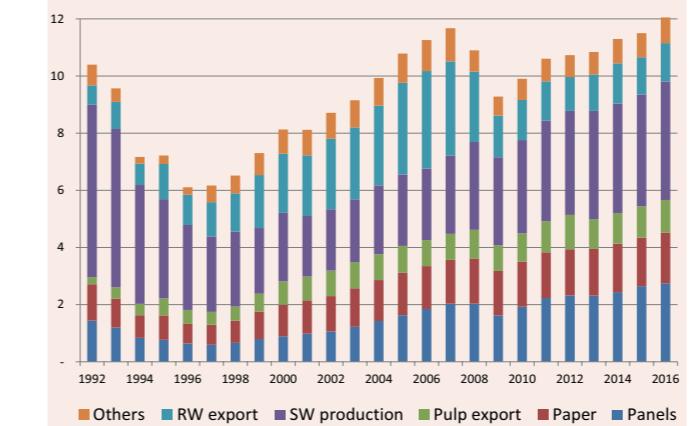

*) majority of domestic consumption is based on import

**Fig. 12. Production and consumption of main forest industry products in Russia, 1992–2016**

"of considerable volume": either as domestic oriented products (in light blue), or as export oriented products (grey), or both (dark blue). The top boxes represent the raw material, and then it goes from top to bottom following the value adding steps towards the corresponding (industrial) end-uses. The arrows represent the material flow. Again, nice and friendly (give it a try).

Physical volumes of production and consumption by the main groups are shown on Fig. 12. In all the cases, official statistics give relatively good picture.

Fig. 13. Manufacturing of key commodity products in the Russian forest industry by segments, 1992–2016, in constant prices (average prices of 2016, USD)

However, some adjustments were needed in each of the product groups. For example, fiberboard production is reported in the statistics in square meters while particleboard production is reported in "conventional m³" – in both cases there were certain tricks involved to get to the real cubic meters. Even more amusing is the situation with sawmilling: since 2013, official apparent consumption in Russia (as official production + official import – official export) is ...negative. It roots to the fact that all small sawmilling companies are out of reach of the statistics. Similar situation is seen in pellet production. Pulp-and-paper sector is much more concentrated and straight-forward in terms of stats. However, some tricks were needed here as well due to diversity of the raw materials and the products in those groups.

Now let us have a look at volumes in money term to compare the size of different segments and to get to the size of the forest industry in the whole, covering main commodity products. The development is shown in constant prices (USD, 2016 average) in 1992–2016 (Fig. 13). To keep it simple and logical, the total was calculated in such a way that the total does NOT equal to the sum of the parts. The reason for that is our desire to avoid double counting. E.g., harvesting supplies all other segments in the country as an input (excluding the volume directly exported as round wood). Adding revenue of sawmilling sector to the revenue of harvesting sector would create double counting as price of sawn wood has a round wood component in it already. Similar approach was applied in pulp-and-paper sector and so on. The numbers include commodity products only.

A WAY FORWARD

Russia sits on the top of the world's largest forest resources both in terms of forested area (some 800 million ha, app. 22% of the global) and in terms of growing stock (app. 24%). Brazil comes as the close second, but Brazil is

Fig. 14. Development of actual cut in harvesting operations in Russia, 1970-2016, mln m³/a

in the 1990s and the water transportation (excluding barges) met stricter legislative limitations. The third obvious reason is the investment climate, as forestry business requires long term planning and long term predictability (but more on this latter).

Actual cuts differ significantly from region to region while remaining more or less stable inside the given regions. The greatest harvesting is seen in Siberia, the North-West and the Volga Federal Regions. Those three regions make up approximately three-quarters of the total volume in Russia. Out of the three regions, the AAC utilization is the highest in the North-West (over 35% of the annual allowable cut) and the lowest is in Siberia (some 15%).

With all those difficulties present and stated, we have to admit that wood supply situation in Russia is better than pretty much anywhere else on the planet. OK, let's be more cautious: anywhere else in the Western hemisphere. Russia can offer wood resources of really large scale, and at low price. The opportunities are definitely there, especially when/if the country gets ready to switch to Scandinavian model of intensive forestry and to improve the investment climate.

To feel the magnitude of the opportunities, let's compare just one "small" region of Russia with Russia's neighbour: Finland vs. Sverdlovsk region.

Sverdlovsk region is located between Europe and Asia, along the Ural Mountains. The area of productive forests in the Sverdlovsk region is only twice lower than that of whole Finland. However, the volume of harvesting in the Sverdlovsk region is nearly 10 times (!) lower than in Finland. Such simple and rough comparison with Finland allows one to conclude that the Sverdlovsk region could have, e.g. at least several dozens of large and medium size sawmills. At present, there are none (Fig. 15).

Russia has one of the lowest prices of main inputs for the forest industry production globally: wood, energy, labour, chemicals. The country can offer a large and should-start-to-be-growing-again market for the key forest industry products, to complement the export opportunities. Stretching half way across the globe, Russia is in perfect position to serve large markets both in Europe and in Asia.

The investment climate might have been better while it is improving, at least from certain perspectives. In the Doing Business rating Russian position might be already considered very good: the rating is 40 for 2017 vs. 123 in 2011 (!). And there is always an opportunity to have a local partner to decrease the country specific risks. For one of the examples of potential partnership you do not need to go any further than several centimetres down below (see the advertisement near the article; Pöyry assists in development of this project).

Alexey BESCHASTNOV, Senior Consultant,
Pöyry Management Consulting

far. Russia absolutely dominates the Western hemisphere in terms of forest resources. However, not many people believe it's important. Why is that so? The reason is, not that much forest is commercially available.

The growing stock (if one is able to get to it) is generally good for commercial use. About one third of it, some 29 billion m³ out of total 83 billion m³, is concentrated in mature and overmature industrial forests. Softwood forests account for approximately two thirds of the forested area. Annual allowable cut (AAC; represents theoretical number of how much of wood can be removed from the forests on the sustainable basis) in Russia is at some 650 million m³, definitely an impressive number.

However, the AAC is utilized by only some 30%, 217 million m³ in 2016. Such a gigantic gap between the available cut and the actual cut can be partly explained by a lack of (forest) roads, and a lack of lower grade wood consumers in many areas – in short, due to the poor commercial availability.

In recent years, actual cut in Russia was at a level of 200 million m³/a, with some 2/3 of the volume as softwood. The volume is significantly lower than the one seen in the Soviet era (Fig. 14), which can be explained, in the larger part, by much lower volume of sawmilling as well as much lower volume of fuelwood consumed starting from 1990s.

Can Russia go back to the harvesting volumes seen in the USSR times, or go even higher than that? It can. But it will not, at least not any time soon. In terms of transportation, Russian harvesting relied heavily on short-span forest rail roads and on water transportation. The roads were mostly lost

LOOKING FOR A PARTNER LIKE YOU

Andrei Kozitsyn, CEO and co-owner of UMMC group, and a Russian billionaire with a net worth over 3.5 bln USD, is looking for a partner for a forest industry project in the Sverdlovsk region, Russia. Ural Mining and Metallurgical company (UMMC) operates over 40 companies in Russia and globally, having more than 80 000 employees. With revenues of USD 5.1 bln in 2015, UMMC is one of the largest metal and mining holdings globally.

PROJECT

- Andrei Kozitsyn is looking for a partner to establish forest industry operations in one of existing sites of UMMC in the Sverdlovsk region, Russia. The objective of creating such partnership is to decrease potential technological and marketing risks through attracting an experienced industrial player. The potential partner would in its turn face less risks with regard to permitting, infrastructure, and site as well as due to having a local support.
- Pöyry (global consulting and engineering company) assists in the development of this project. Based on a feasibility study conducted by Pöyry in 2016, production of sawn timber, pellets as well as PB/MDF appears to be the most lucrative areas for the project.
- A potential partner** should have experience in sawmilling, pellet, and/or wood-based panel operations based on Western machinery. **Being experienced** in start-ups of new large scale mills as well as in production/marketing in Russia and EU would be an advantage.

BENEFITS FOR THE PARTNER

UMMC offers an up to 50% stake in the planned business as well as support for the project at the local and federal level, to include permitting procedures, site preparation, construction process, forest leases, priority project status and other means to make the project a success.

The project would also benefit from one of the lowest costs in Russia (and globally) in all major input components in the forest industry: wood, energy, labor, resin.

Timber-Logging Process Modernization Is a Strategic Goal of Russian Forest Industry Development

Russian economy has been going down for the second consecutive year: -3.7% in 2015 and -0.2% in 2016. In such periods for the Russian economy, the main part of which is based on the incomes from its hydrocarbons export, issues related to searching for additional budget replenishment sources are getting extremely important. One of such opportunities is the increase of Russian forest sector's contribution into the country's GDP, which is currently up to 1%.

Russian forest industry is of serious interest for foreign investors. We hope that this article will help the investors to make the right choice of business in Russian forest industry.

Timber-logging industry is the basis of the forest industry and the locomotive of its development. However, constantly increasing wood cost stops being the key competitive advantage in the production cost of the finished products when they are sold at the global markets. If problems in timber-logging industry are solved, the level of the forest sector as a whole can be raised, which would increase its contribution into the country's GDP and reduce business expenses.

Timber-logging industry has suffered more than other industries during the transition to market relations. Low efficiency of timber-logging enterprises' work makes an adverse impact on work of the entire forest industry complex. Therefore, improvement of timber-logging efficiency is the top priority task in making forest industry complex work efficiently. Under unfavourable investment climate conditions, its solution is the

most achievable one from the economic point of view, since the timber-logging industry is the least capital intensive one and its return is rather quick.

In this article we describe only the problems and solutions in timber-logging industry, without going into details about the forest management issues. Technical and technological solutions aimed to improve the timber-logging industry efficiency will be in great demand for Russian forest industry businessmen, as well as they will ensure long-term stability of their businesses.

TIMBER-LOGGING VOLUME IS GROWING

In 2015, the timber-logging volume in Russia has exceeded the level of 1992 for the first time during this 20-year-period. In spite of the fact that the volume of investments in equity of the

timber-logging enterprises for these four years is lower than during the pre-crisis period from 2005-2008, the enterprises continue on increasing the timber-logging volumes. According to the results of 2016, the volume has grown by 3 mln m³.

RAW MATERIALS ARE THE MAIN COST ITEM IN FINISHED PRODUCT MANUFACTURING

The necessity to solve the problems in timber-logging industry is seen at calculating the costs of wood and paper-based products manufacturing. The review of costs shows that the largest one is the raw wood cost. Reduction of this cost will have a positive effect on efficiency of all branches of forest industry complex and will allow the exporters of finished products to compete efficiently at the global market.

HOW TO REDUCE RAW WOOD COSTS

1. TO GENERATE ENTERPRISES' OWN POWER USING WOOD FUEL

The main power resources used by wood processing companies are heat and electricity. The total value of these costs together with the raw materials cost is the largest item and makes around 40–45% of total costs. The cost reduction will make a positive impact on work of all other branches of forest industry and will make favourable conditions for deep wood processing development.

Wood and power production costs are interrelated. In fact, if the wood waste which makes 50% of processed raw materials is not used, the total value of raw materials depends on the primary cost of wood processing products.

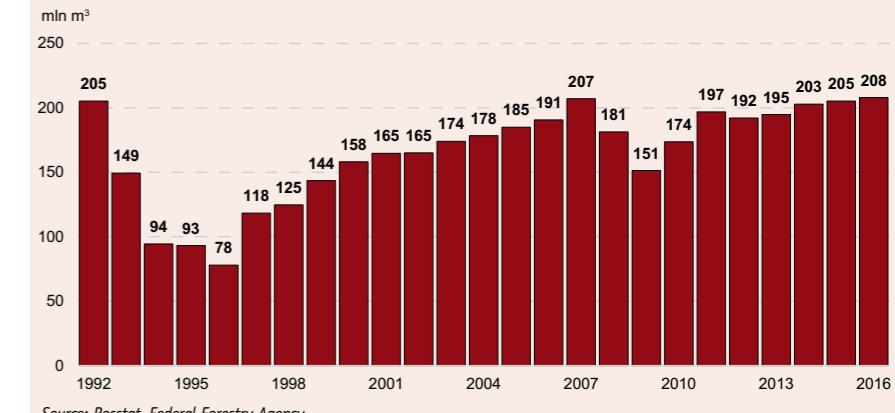

The same occurs when low-quality wood is used inefficiently. There are cases when timber-logging enterprises, especially in Siberia and the Far East, in order to keep their profitability, take only the merchantable part of the stems: sawlog and pulpwood. The losses related to disposal of the left wood should be covered by the enterprises from the sales of industrial wood or finished product. Our calculations show that elimination of these losses will allow the costs to be reduced appr. by 20%.

The universal way to use low-quality and waste wood efficiently is wood fuel-based energy generation. This type of wood can be used to produce one of the most highly liquid types of products – energy. According to our estimates, the primary cost of heat and electricity generated by the forest industry enterprises on their own co-generation thermal electric power plants using the wood fuel is 2 or 3 times less than the existing rates nowadays. Thus, development of fuel-based energy generation in the forest industry allows an enterprises to use firewood and waste wood efficiently to generate an enterprise's own heat and electricity at a cheaper rate than the purchased ones and to increase profitability both of industrial wood and its processed products.

Available resources of the wood fuel in the forest industry complex of Russia according to the production volume of paper-based products are about 90 mln m³. Calorific value of economically affordable wood fuel in the forest industry is over 500 PJ (petajoule). This potential capacity can satisfy forest industry demand for heat and electricity appr. by 75%, and if low-quality wood is harvested purposely, it can be fully met.

Analysis of wood fuel resources structure by the types of wood fuel shows that appr. 78% of the total resource amount is formed at timber-logging enterprises. 63% of them is wood, 15% are branches and limbs when the timber is moved from the forest as trees (with the top). Timber-logging and moving it from the forest in the form of trees is a proven technology which has been used in Russia for a long time. When chips are produced from limbs, the whole tree timber being moved from the forest, its production efficiency

Chart 1. Timber-Logging in Russia in 1992–2016

is several times higher than shown by foreign cutting-edge technologies.

The country has all types of key equipment necessary for thermal power plants: steam boilers and turbines. However, the technology of burning milled wood fuel lags far behind. That is why cooperation in high-efficiency firing installations manufacture for Russian boilers, for example with Wellons Company, the USA, would be interesting.

Thus, to improve work efficiency of the forest industry complex and to develop deep wood processing successfully, it is necessary to focus on reduction of raw wood production cost, i. e. on improvement of work efficiency of timber-logging industry, as well as on development of heat and electricity production at forest industry enterprises using wood fuel.

2. TO SELECT REASONABLE TIMBER-LOGGING TECHNOLOGY THE MOST EFFICIENT FOR RUSSIAN CONDITIONS

Disintegration is one of the main drawbacks of the entire forest industry. Disintegration occurred

during the transit to market relations at the beginning of 1990s. The structure of timber-logging industry in accordance with timber volume logged by timber-logging enterprises is shown in Fig. 2.

The enterprises with the annual volume of timber-logging up to 50 ths. m³ make 93% of the total amount of timber-logging enterprises. They log about 34% of annual volume. Analysis of the structure of timber-logging industry shows that its restructuring is one of the most important tasks for the forest industry complex.

Enlargement of the timber-logging enterprises allows them to reduce cost of logging 1 m³ of wood, as well as to reduce timber-logging and timber carrying vehicle maintenance cost.

3. TO SELECT REASONABLE TIMBER-LOGGING TECHNOLOGY THE MOST EFFICIENT FOR RUSSIAN CONDITIONS

Another serious problem for timber-logging industry is non-cost effective replacement of

Chart 2. Investments in Equity of Timber-Logging Enterprises

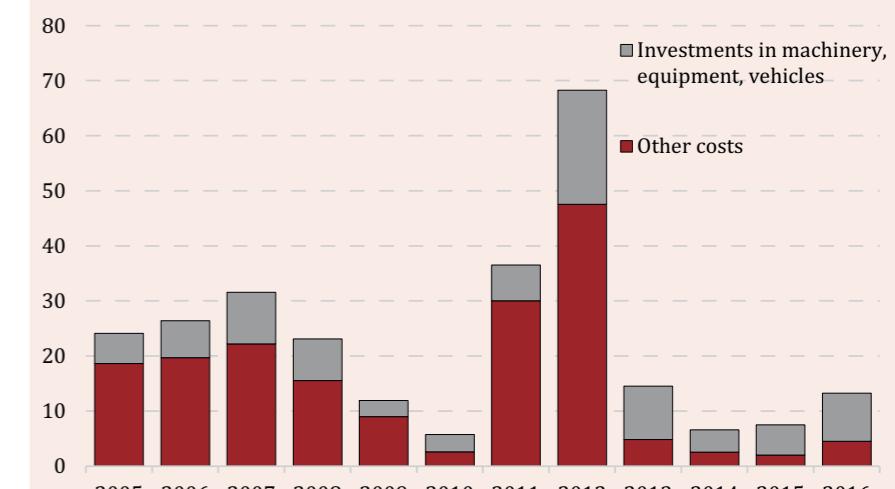

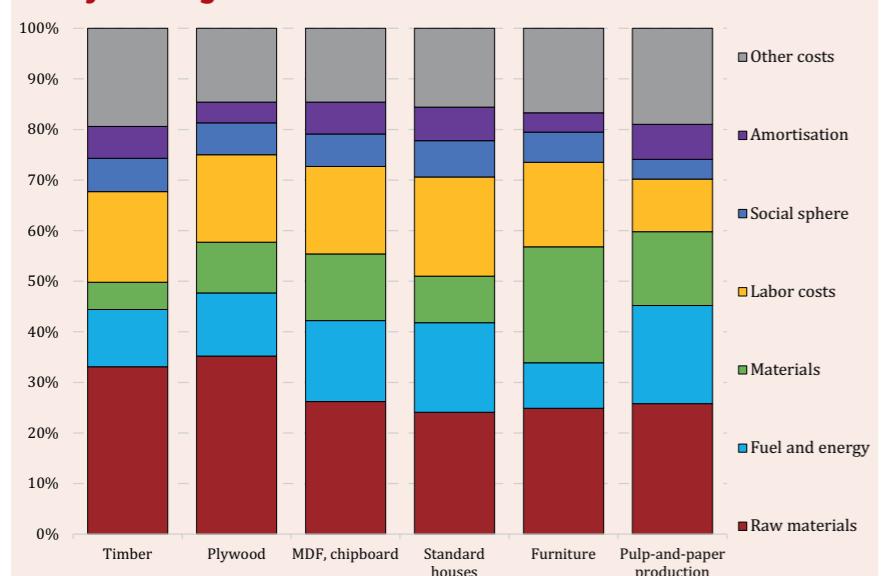

Chart 3. Breakdown of Wood and Paper-Based Products Manufacturing Costs

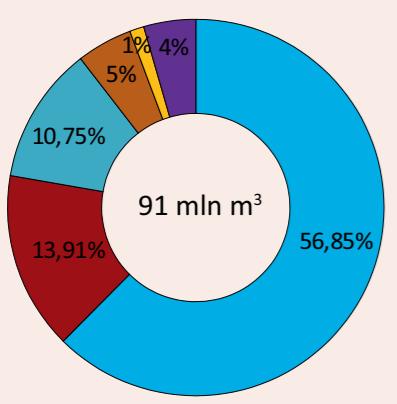

Source: Head Forest Industry Scientific Centre for Technology and Power Engineering

whiplash technology by cut-to-length (CTL) one. The wide use of harvester-forwarder machines is explained by existence of small enterprises in the forest industry. However, this system is also used by some large enterprises.

It is known that the whiplash technology is a domestic invention. The first experience

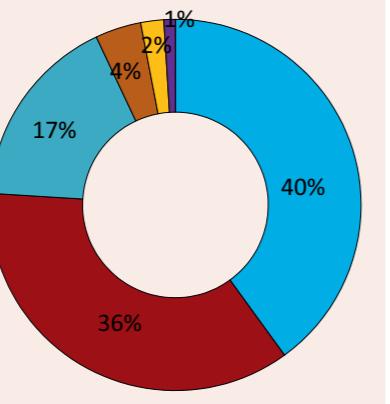

of its implementation dated back to 1948. Within the short timeframes, 1950-1955, it was implemented nationwide under the leadership of the forest industry minister Georgy Orlov. The annual productivity growth in forest industry at that period was 10% and by 50% for the five-year plan period. Until 90s, 96% of the

Fig. 1. Available Resources of Wood Fuel in Timber Industry

Source: Head Forest Industry Scientific Centre for Technology and Power Engineering

Fig. 2. The Structure of Logging Industry by Volumes of Logged Timber

Source: Head Forest Industry Scientific Centre for Technology and Power Engineering

total amount of timber was logged according to this technology.

Further on, this technology was widely used in the USA and Canada where it was essentially developed. The USA and Canada experience proved that the whiplash technology is much more efficient than CTL as the Russian forests did not get thinning.

Analysis of the tree structure by the timber volume and number of trees shows that mature merchantable trees make about 50% of the total volume and 30-40% of the total amount of trees. Undersized trees make 20% by of the volume and 40-50% of the total amount of trees. Large-sized, overripe trees (firewood ones) make about 30% of the total volume, and about 20% of the total amount of trees at the logging site.

The trees on which harvesters achieve high productivity make about 50% of volume in our forests. As for overripe (firewood) trees with large knots, they are just beyond the capacity of harvesters, the typical size of which is selected by the size of the dominating mass of trees.

Efficiency of timber-logging can be improved at the expense of timber processing into fuel chips and development of wood fuel-based power generation. However, the primary cost of fuel chips production from CTL firewood is higher than the same of merchantable timber production by the value of cost related to the wood milling into chips. It reduces efficiency of energy generation use of firewood.

It is known that in the USA, as far back as in early 70s of the last century, they started to mill low-quality hardwood trees into various purpose chips with movable woodchippers. By eliminating a lot of labour-intensive CTL operations and using the opportunity to mill low-quality undersized trees by groups efficiency of chip production from trees as compared to its production of CTL wood is tremendously increased. At the expense of the trees' tops the volume of produced chips increases by 12-14%. Chips are used as fuel and for particleboard production.

During harvesting and conversion of undersized trees powerful harvesting equipment is practically idling. For their logging and conversion, it is reasonable to use group (multistem) methods, such as feller bunchers equipped with claw-like felling units with accumulator for trees, installations for pulpwood production by a group method, limp removing barking chippers for processing undersized trees into the "white" debarked chips for pulp-and-paper industry.

Analysis of the US timber-logging experience in pre-thinning timber stand shows that under Russian conditions practically half of the total amount of logged timber might not be processed into CTL timber because the trees can be processed into chips and chip fuel, avoiding the stage of CTL wood production.

Production of CTL timber from this half is cost-increasing and unnecessary work.

Thus, cooperation with foreign companies in the area of forest machine-building, making joint ventures for manufacturing machines for stem logging, as well as other machine building products is important nowadays. Experience with construction of automobile plants in Russia proves that such cooperation can be promising.

4. TO MINIMIZE THE SEASONAL NATURE OF WORK IN TIMBER-LOGGING INDUSTRY

Another serious problem of timber-logging industry is the seasonal nature of its work. The seasonal nature of timber-logging is the result of unique natural conditions of in our country. Soft swamp soils are "Achilles' heel" of Russian forests. Forest soils of category III and IV make 57% of the total forest area.

For several decades in the USSR, work was as follows: 71% of annual timber volume was logged for five winter months: from November till March, the rest 29% was logged for 7 months. The seasonal work was possible due to the cheapness of wood harvesting machines at that period and also because the state provided cheap credits for making inter-seasonal reserve of stems.

Nowadays the problem is getting rather serious due to the global warming. Winters became unstable with numerous thaws. Our research showed that the winter period, most favourable for timber-logging, has reduced for the past 20 years from 5 to 4 months, i.e. by 20%, and the volume of timber logged for winter months has reduced from 71% to 48%, i.e. by 32%.

Not only timber-logging enterprises but also wood processing and pulp-and-paper ones create inter-seasonal timber reserves.

Two factors pre-determine the timber-logging seasonality:

- Problems with primary timber transport within the logging site from the felling place to the haul road, i.e. the problems with the timber skidding;
- Problems with timber transport due to poorly developed transport infrastructure, lack of haul roads available all year round.

The problem of road pattern for the logging sites with swamp soils (timber skidding) is technically more complicated. All attempts to create skidding machines capable of smooth work at the logging sites with swamp soils taken by leading machine building companies all over the world failed. Currently, we have to say that there are no skidding machines in the world capable to work efficiently with soft swamp soils.

As far as construction of timber transport roads working all year round is concerned, it is mainly an economic task. The high cost of timber transport road construction is also connected with unfavourable soil conditions. In

places with soft and swamp soils the deposits of road construction materials are rare. Distant delivery of road construction materials makes construction more expensive. Under these conditions the enterprises have the task to select the most affordable technologies of timber transport road construction from local construction materials.

Russian forest businessmen will use the experience of the foreign companies in reduction of the timber-logging seasonality and in mechanisms of financing timber transport road construction.

5. TO ORGANIZE WOOD PROCESSING FACILITIES AT TIMBER-LOGGING ENTERPRISES

The changes in the situation with transportation service costs, insufficient development of transport infrastructure in the country, the problems with timber transportation by railroad, the restrictions related to timber drift require change of attitude to optimal concentration of wood processing facilities. Reduction of round timber transportation distances, development of wood processing facilities at timber-logging enterprises become one of the primary goals in improvement of forest industry efficiency.

Wood sawing is the basis for entire wood processing. Choosing the wood sawing technology it is useful to consider the specific features typical for timber-logging enterprises which make them different from sawmills, and saw milling, and wood processing enterprises working on purchased raw material.

Most enterprises work in overmature forests with hardwood dominating in them, the share of which is 75%. That is why it is essential for the timber-logging enterprises to use the universal sawing technology, which provides processing of soft wood as well as defected hard wood including rot.

Also the wood sawing technology does not require detailed sorting of raw material in accordance with diameters. Detailed sorting freezes raw materials parts.

The types of wood processing products which can be made directly at the timber-logging enterprises must be identified in accordance with the results of marketing research. One of the main type of products released by timber-logging enterprises to recommend is manufacturing wooden houses and their parts. The enterprises of different regions can produce the wooden houses using different technologies in accordance with the climate conditions, house building traditions and wooden raw material quality and dimensions. The houses can be customised. MHM technology for building houses is also very interesting.

At the current stage of the country development it is very important to solve social problems related to providing the residents of small settlements with modern and comfortable housing. One-floor wooden houses built up before the war and after the war in small settlements became outdated. They create

negative image for the country and reduce its investment attractiveness. The forthcoming period in timber-logging industry development can come down into the country's history as the period of one-storey Russia resettlement.

Development of house-building production in timber-logging enterprises in relatively small volumes will allow to reduce risks, lead to competition which will increase the quality of houses, their variety, take into account customers' wishes and reduce prices.

Creation of the Pilot Energy Self-Sufficient Timber-Logging and Wood Processing Enterprise As an Example to Follow

In the USSR an important role in the industry development was played by pilot integrated timber-logging enterprises under Central Scientific-Research and Project Institute for Mechanization and Forest Industry Technologies (TSNIIME), where new technologies, machines and equipment were tested in different natural and climate conditions. In the European part of the country the enterprises tested technologies of work in the conditions of swamp logging sites and felling area resources of low-quality with hardwood dominating, in Siberia - technologies of machine operation under the severe climate conditions; in the Caucasus equipment and technologies for timber-logging in mountains were improved. The enterprises were examples to follow for building new and upgrading already existing timber-logging enterprises. Nowadays these enterprises are destroyed. To facilitate the restructuring and upgrading process in timber-logging industry, it is necessary to create such enterprises again. Highly-efficient timber-logging enterprises have to become examples for investors to follow.

Foreign investors including the forest industry, wood-processing and power generation machine building sectors can become interested in implementation of the suggested project. Currently, these companies offer Russian customers the machines, (machine systems) and equipment for performance of certain operations or a part of technological process called "logging site – finished product of wood processing". At such system of sales a customer never gets maximum economic effect because efficiency is improved only at one certain phase of the process, it can have a small effect on the final result. This is reflected in the interest of the customers in the equipment acquired.

The maximum synergistic effect, for example, from the production of wooden houses will be obtained only when the entire technological chain will be created, from the logging site to turnkey facility commissioning. Demonstration of this effect to potential customers at an existing enterprise will allow to increase the volume of equipment sales to all participants of the project.

TRIM MOULDING

Moisture: 14±2
Wood species: spruce, pine

Advantages wooden trim mouldings:

high quality of exposed surface

wide range of sizes,
possibility to produce
materials of non-standard
size

certified quality

EUROBATTEN

Main profiles: 12,5x96 mm
Length: 2 to 6 m*

Sort: AB, C

BUILDING TIMBER IMITATION

Main profiles: 28/36 x 145/195 mm
Length: 2 to 6 m*

Sort: AB, C

BLOCKHOUSE

Main profiles: 28/36 x 145/195 mm
Length: 2 to 6 m*

Sort: AB, C

FLOOR BOARD

Main profiles: 25/26/28/36 x 96/145 mm
Length: 2 to 6 m*

Sort: AB, C

EDGED BOARD

Moisture: 18±2 Length: 2 to 6 m*
GOST 26002-83 Thickness: 16 to 70 mm
Sort I-IV and V Width: 75 to 250 mm

SPRUCE, PINE

BAR

Length: 2 to 6 m*
Thickness: 30 to 50 mm
Width: 30 to 50 mm

+7 (48438) 6-09-37, 2-05-05 fax
+7 (495) 223-69-46

Product types: floor board,
blockhouse, building timber
imitation, eurobatten

Sort: AB.

Wood species: pine, spruce.
Production of plank of other
wood species is possible upon
prior agreement.

Wood moisture content: 14±2 %
(drying process of 120-168 hours).

Package: polyethylene film,
steel band binding.
Maximum package weight:
does not exceed 35 kg.

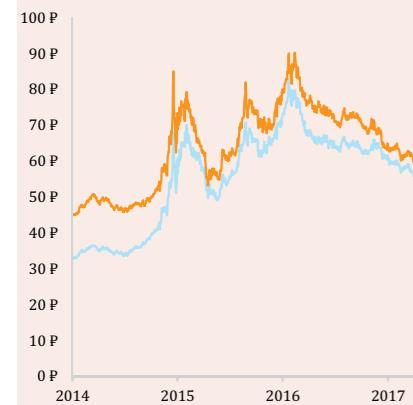

Timber Industry in Russia: Dramatic Increase of Export

2016 was a stable year for Russian sawn softwood exporters in comparison with catastrophic drop of world markets at the end of 2014 and in the course of the year 2015. Positive economic news in the world market started to come at the end of II quarter of 2016 and showed brightening prospects. Sawn softwood prices on external markets ceased dropping and the preliminarily assessed world demand has increased by 8 % (YoY).

In 2016, the Russian ruble has rallied against the US dollar, being the main currency for sales of Russian timber. Correlation between the currency and prices on Russian timber expressed in US dollars is clear: prices increase with dollar dropping.

In 2016, the volume of softwood lumber exports from Russia increased by 11% amounting to 24.8 thousand m³ or + 2.4 mln m³ in absolute expression.

The Russian Ruble Exchange Rate against Euro and the US dollar from May 2014 to 2017

Source: WhatWood, the Central Bank of the Russian Federation

High demand on softwood lumber in China led to impressive enhancing of export from Russia in 2016: + 37% (YoY) up to 13.4 mln m³. Main competitors from Canada had lowered the turnover (-6% YoY) having diversified to the growing American house-building market. Nowadays, Russia is the main vendor of lumber to Chinese woodworking, furniture and building sectors, though as recently as in 2012, the volumes distribution between Canada and Russia have been 50/50. In 2016, Northern Europe countries – Sweden and Finland due to their national support programs have significantly built up export promoting their products in Chinese market.

Russia is not the only market player on the world market of sawn softwood. There are intricacies in special products categories, but in general the main Russia's competitors are two regions: Northern Europe (Sweden, Finland) and Canada.

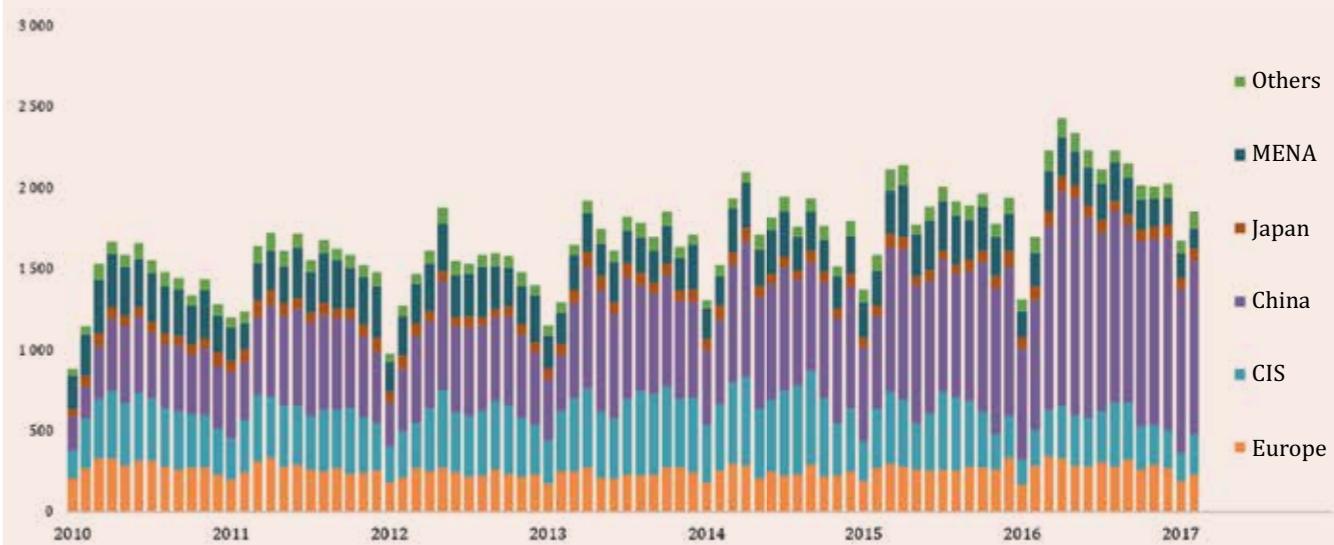

The Russian Ruble Exchange Rate against Yuan from May 2014 to 2017

Source: WhatWood Monthly Lumber Report

Egypt, China and Japan markets show high competition between the Russian and European manufacturers in certain niches. Finland, Sweden and Canada have also increased sawn softwood deliveries to the world market of sawn softwood.

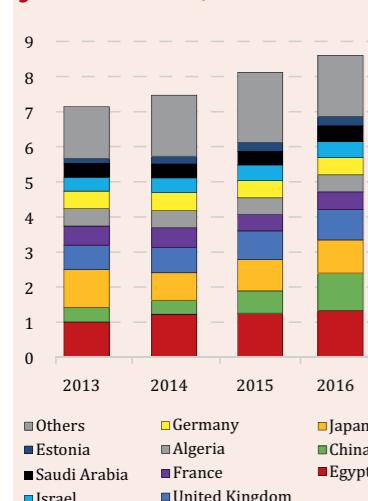

Alongside with that, the decision of the US government to impose temporary duties of 3 to 24% on imported softwood lumber for top five Canadian companies: West Fraser Mills, Tolko Marketing and Sales, J.D. Irving, Canfor Corporation, Resolute FP Canada, and 20% for all other companies, which would affect the world's trade balance. Canada is the world's largest manufacturer of sawn softwood. As of

the end of 2016, Canada manufactured 67 mln m³ of lumber, with 45 mln m³ sold in the USA.

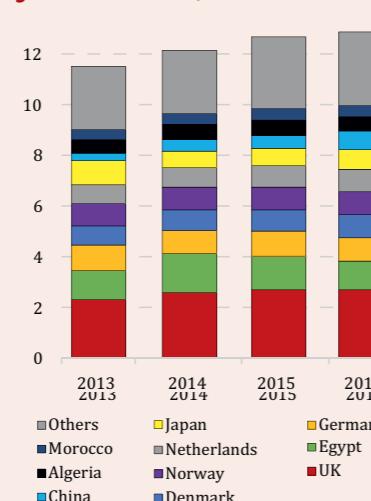

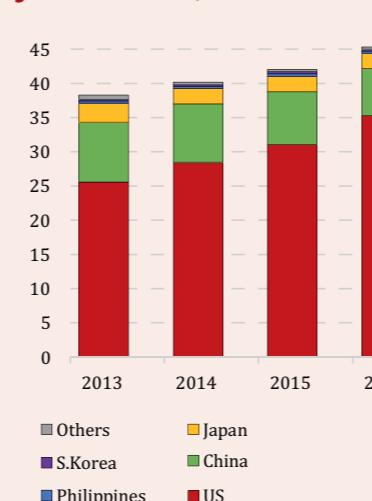

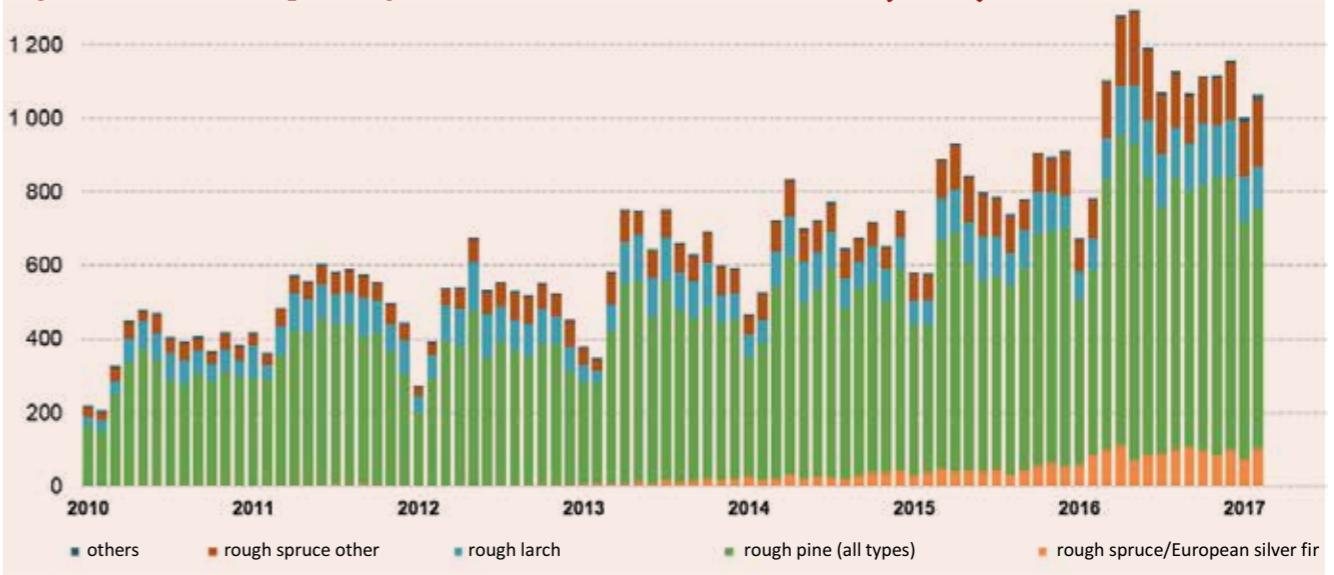

European manufacturers came under pressure after box rate surge. 2016 forecast showed increase of rates for container transport from the Baltic countries, Finland and South-Eastern Russia to the ports of Asia. By the end of 2016, the average 40HQ rate increased from \$1100 to \$1800.

JAPAN

Japanese market is traditionally the most complicated sawn materials market due to special working conditions and requirements, but with a high margin and profitability. According to the results of 2016 the softwood lumber exported

Softwood Lumber Exported from Finland, mln. m³

Source: ITC

Softwood lumber exported from Sweden, mln. m³**Softwood lumber exported from Sweden, mln. m³****Softwood Lumber Exported from Russia to China in 2010–2016 (th. m³)**

from Russia to Japan increased by 7% amounting to 910 thousand m³. This is the third year of increase in succession.

The peak in demand increase has been shown in planed spruce lumber segment and amounted to +33% (YoY) up to 44 thousand m³. Demand for rough-edged spruce lumber increased by 17% up to 105 thousand m³, rough-edged pine lumber – by 9% up to 248 thousand m³, and planed pine – by 4% up to 459 thousand m³.

Yen to US dollar exchange rate has significantly helped the importers throughout the year. In May–September the rate fluctuated at 100–105 yen per US dollar. This contributed to sawn lumber price surge in the internal market.

The highest WhatWood price index has been reached in planed spruce lumber: +24% up to \$313/m³; rough-edged spruce: +15% up to \$211/m³; rough-edged pine: +9% up to \$224/m³; planed pine has remained the same, \$299/m³.

Bank of Japan preserved target rate of return of 10-year government stocks at the level of around 0% and deposit account notice rate of commercial banks in the Central Bank at the level of minus 0.1%. The Central Bank of Japan marked off of the comfortable credit conditions and increase in government and administrative expenditures, which is partly related to the coming Olympic 2020 in Tokyo. These conditions allow for speedier recovery of economy despite the recent drop in consumption and investment.

According to the regulatory forecast, the economy is due to rise by 1.4% within the current financial year to end on March 31. The previous forecast anticipated 1% increase. 2017 assessment has been improved from 1.3% to 1.5%, for 2018

financial year – from 0.9% to 1.1%. This financial year, similar to the previous, Bank of Japan forecasts average annual deflation. Landslide of consumer prices without regard to fresh food products may amount to 0.2% (in October the number mentioned was 0.1%). In 2017 financial year, the forecasted average annual inflation is 1.5%, in 2018 – 1.7%.

Inflation in Japan is still far from its target value of 2%, but the recent downfall of yen against the US dollar relieved pressure on the Central Bank as the native currency weakening results in pressure buildup of inflation.

The country continues to suffer from depopulation and manpower tightness. In January 2017, the Japanese government reported rapid inflow of immigrants. The country aims at attracting more foreign workers, but the high-skilled professional are not too quick to choose Japan. Tokyo still shows population graying and decline. According to the statistics as early as in 40–50 years the current 127 mln will be diminished to 87 mln, and half of the population will be retirees. As forecasted, the population within the country is going to decline by third in 2060 which will entail in recruitment of foreign workers.

According to preliminary assessments, the scope of housing development in Japan has increased by 7% within the calendar year and amounted to 972 thousand units. A range of researches show that in the last 112 months the construction industry in Japan attracted large sums of investments with low interest bank rates. Alongside with that, housing prices started to rise outrunning the wages, which especially affects the demand on the part of young Japanese families.

CHINA

Favourable situation on the Chinese house development market, increase in furniture sales and yuan strengthening against the US dollar create prerequisites for rise in prices for sawn materials. In 2016, softwood lumber exported from Russia to China showed an impressive growth: +37% (YoY) up to 13.4 mln m³. In 2015, the accession rate amounted to 17% against 2014.

Many companies, including sawn pinewood market players, redirected part of their products with similar specifications from Egypt market to the markets of the CIS and China.

EGYPT

Unstable market of Egypt, with high volatility, is hard to be forecasted both on the part of costs and on the part of scope of sales for the Russian log-processing companies. Russian sawn softwood deliveries to Egypt market in the IVth quarter of 2016 remained at minimum historic level, and in December 2016 amounted to 70 thousand m³ (-42% YoY, -10% MoM). According to the 2016 results, export from Russia dropped by 24% down to 1.5 mln and rolled back to the level of 2014.

Rough spruce lumber deliveries in 2016 decreased by 24% down to 143 thousand m³, rough pine – by 25% down to 1.3 mln m³ and rough larch – by 22% down to 56 thousand m³. The one segment showing increase in delivery is Siberian spruce sawn lumber: +49% up to 31 thousand m³.

In November 2016, the Central Bank of Egypt declared transition to floating native currency rate. Next, the Egyptian pound spiraled by 50% against the US dollar. As of the end of the year, the rate was 17 pounds per US dollar against

7.8 pounds, as of the beginning of 2016. Thus, Egyptian currency was devalued twice in the same year.

The government brought itself to such measures in order to minimize the gap between the official rate of American currency and its actual value on the "gray" market. The government hopes for IMF credits (in the end of 2016, \$ 12 billion loan agreement has been reached) and World Bank credits, as well as the financing to be received from the USA.

With underlying drop-down of the national currency the consumers found themselves in awkward situation of having no means for settlement with lumber vendors due to the heavy lack of currency within the country.

Low paying capacity of Egyptian buyers remains the main reduction factor for sawn materials deliveries from Russia. Citizens of Egypt suffered the tax increase, rapid food products inflation (approx. 19%) and reduction in state subsidies. Government of Egypt has leveled up prices by 25% to 40% and imposed 13% added-value tax in August 2016. Lack of foreign currency attraction capacities restrains economy development.

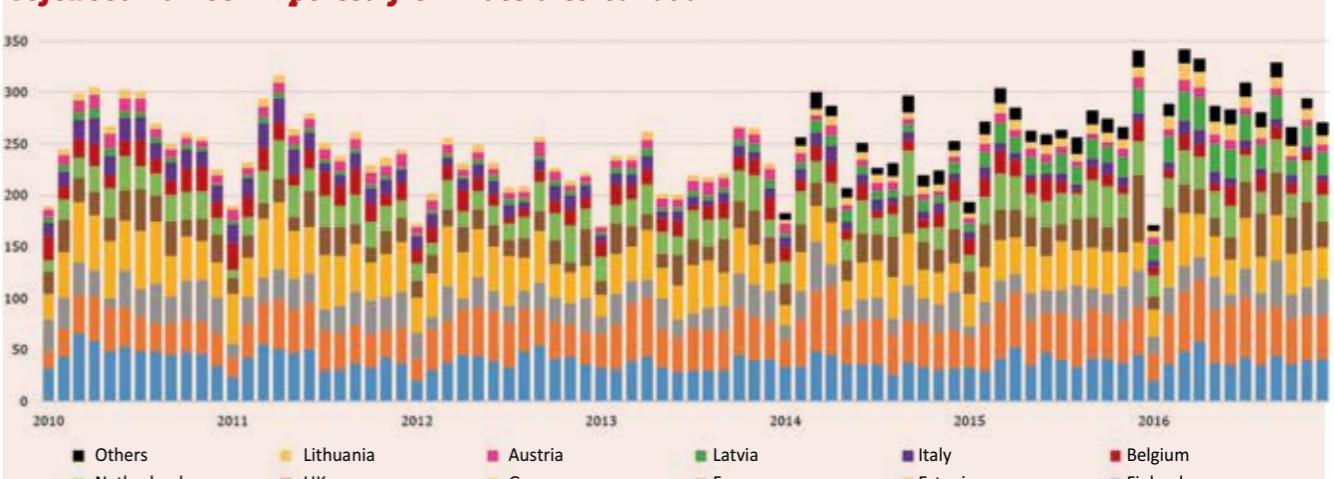

Growth of free market oil prices in November–December after meeting of OPEC was also an additional negative factor affecting the economy of Egypt, as the country has to import hydrocarbon in order to satiate the internal needs. With 12% budget deficit the authorities of Egypt are

forced to adopt severe economic measures for stabilization of situation. Government of Egypt is compelled to spend significant part of its budget to subsidize strategic and socially important products, gasoline in particular.

EUROPE

In 2016, Estonia remained the top customer of Russian sawn lumber, having increased purchase by 10% up to 589 thousand m³, with Finland on the second place with 476 thousand m³ (-0.5%), and Germany on the third place with 471 thousand m³ (+6.6%). Total scope of export from Russia to Europe in 2016 increased by 6% up to 3.5 mln m³ delivery.

S Timber Export: New Trends and New Products

According to the results of the end of 2016, woodworking enterprises of Russia went on ramping up timber export. The raw timber is still remaining the main category of exported products. However, more and more domestic woodworking enterprises start exporting materials, which are new for the Russian market, including deeply processed timber.

In 2016, according to data provided by the analytical centre of GS Group investment and industry holding, the timber volume exported from Russia was 16.7 mln tons (30.6 mln m³) which is by 15% more than in the previous year. Timber export growth is connected both with the general timber market behaviour and the remaining key advantage of the Russian exporters — the low exchange rate of rouble in relation to main foreign currencies. The biggest European export companies from Sweden, Germany, Finland and Austria have not been able yet to restore their revenue indicators after the last year fall: its average increase for the above countries in 2016 was 3% (after the fall by 17% in 2015).

Along with that, in 2016, the revenue of the Russian exporters grew up both in roubles and dollars. As compared to the previous year, when the currency revenue fell down by 18%, up to 3.12 billion dollars, its increase by 5% was marked at the end of 2016, which is up to 3.27 billion dollars. At the same time, the cost of timber is going down: in 2016, the average price fell down from 117 to 107 \$/m³. However, due to the relatively stable rouble exchange rate (about 70 roubles/dollar) the revenue of exporting woodworking companies grew up by 20% — up to 229 billion roubles.

Unprocessed softwood, mostly fir-tree and pine-tree have stayed the main exported product category for several years already. Export of planed

timber sustainably grows on, its share in the total volume of supplied processed and non-processed timber remains stable at the level of 2.7%. Most of the export volumes of fir-tree and pine-tree are growing up. As far as increasing export of hardwood species is concerned, it is mostly birch and oak timber. The total export volume of processed materials has reached about 1 mln m³ — that is by 14% more than in the last year (most part of which is accounted for the pine-tree — over 600 000 m³).

Export of additionally processed timber is more complicated business than supply of non-processed timber. Processed timber is supplied as intended-purpose product, and the requirements to wood processing and quality are various in different regions depending on application, and are not easy to meet.

Nevertheless, export of planed and profiled timber is more interesting and promising solution than sales of non-processed timber. Though during the first five years of the 21-st century the round wood export volumes showed the highest average annual rate of growth — about 20% a year, in 2006-2007 the situation completely changed. In relation to the export growth rate the products of deeper processing, timber in particular, became the leading ones. One of the factors which caused such a change was the increase of export custom duties for round wood. Reduction of round wood export

growth rate promoted expansion of sawmills' raw material base and then facilitated timber production development and export.

In 2007, according to the Federal Customs Service (FCS of Russia), export of timber grew up by 11.2%. The general supply volume of these products for the period from 2000 -2007 grew up from 7.8 to 18.5 mln m³ — i.e. more than twice. An important factor of growth was increasing demand for Russian timber in the countries of CIS, Europe, Asia and Middle East causing the rise of global prices for this category of products.

Since 2008, at the background of timber export growth the volume of round wood supplies abroad jumped down. In 2009, having declared the course for development of deep wood processing enterprises as one of the state top-priorities in the forest complex, the president of Russia Vladimir Putin actually drew a line under export of round wood from our country. Since 2009, export of round wood started going down slowly, and timber supplies started growing in the same slow manner. In 2012, the volume of timber export reached 18.7 mln m³ and for the first time exceeded the round wood supply volume (almost by 2 mln m³).

Currently, more and more Russian woodworking enterprises get focused on the export of processed sawn products. This is quite natural: the demand for such products is more stable providing more

stable level of sales. Although it requires more attention to product specification demanded by customers, ultimately such diversification allows a woodworking enterprise to have stable contracts for its products. Besides, the profit per cubic metre of processed timber is higher than in standard sawmill business. Due to this advantage the manufacturers minimise their risks and additional expenses and have the opportunity to expand business; the consumption volume of raw materials for sawing remaining the same. Therefore, it can be expected that the number of Russian woodworking enterprises starting to export only the processed timber will grow on.

PROCESSED TIMBER EXPORT

In 2016, planed and profiled timber was the main part of export of all processed timber. Softwood increment was 14%, and the volume of export supplies grew up to 1 mln m³.

The key export category of processed timber is the planed sawn pine-tree timber — up to 61%, despite the fact that its share in the total volume fell down to 72% for the past 5 years. According to the results of the end of 2016, the price of the export planed pine-tree timber went down — from 288 to 268 \$/m³.

The second place is held by profiled pine-tree timber. In 2016, the volume of its export was 223 ths. m³. Export prices for these materials significantly fell down: from 269 to 233 \$/m³. Along with that, the share of planed fir-tree timber supplies is growing fast: according to the results of the end of 2016, its volume increased by 33% up to 140 ths. m³. Its price has also grown up: from 221 \$/m³ to 240 \$/m³.

As concerning planed and profiled hardwood timber, the export volume of these products remains the same as in 2015 — 58 ths. m³. The main timber being exported is the birch-tree: the share of planed birch-tree timber in the total volume is 58% (34 ths. m³). Export of profiled birch-tree materials reduced up to 12 ths. m³.

According to the results of the end of 2016, the planed oak timber volume also grew up — up to 10 ths. m³. This is connected with the fall of price which had been growing during the previous two years, unlike the prices of planed and profiled birch-tree.

Export prices of hardwood processed timber are going down similar to those of softwood. In the past three years the prices became generally half as low as it was in 2016, when the main drop down happened: for planed birch-tree — from 307 to 271 \$/m³, for profiled birch-tree — from 497 to 478 \$/m³, and for planed oak-tree — from 485 to 280 \$/m³.

REGIONS-EXPORTERS OF PROCESSED TIMBER

In 2016, the three leading regions of Russia — exporters of processed timber were the Irkutsk region, the Krasnoyarsk territory, and the Leningrad region. The Irkutsk region which exports almost

half of the total volume of processed timber is in the first place. In 2016, the share of this region's export grew up by 10%.

The second major region is the North-West (up to 18% in total export). Its woodworking enterprises are located mostly in the Leningrad and Novgorod regions, as well as in St. Petersburg and Karelia. According to the results of the end of 2016, the volume of export supplies grew approximately by 30%.

The last of the three biggest exporters of processed timber is South Siberia; the most of companies are from Krasnoyarsk. Abroad deliveries from the region increased approximately by 17%.

Another major supplier of processed timber is the Russian North: the Arkhangelsk region and the Republic of Komi. Export from these regions has increased more than twofold.

PURCHASERS OF RUSSIAN TIMBER

The main purchaser of Russian timber is Japan, where 50% of the total export volume is supplied to. Also the domestic manufacturers export processed timber to Europe, Middle Asia, the USA, China and Korea; Japan is the key purchaser of planed fir-tree and pine-tree (about 68% and 34% of the supplied volume in 2016 respectively). Profiled pine-tree is mainly exported to CIS countries: 13-15% — to Kazakhstan and Azerbaijan, 8% — to Belarus. Another 8% is accounted for Finland. Along with Japan, the planed fir-tree timber is actively purchased by the Netherlands (17%) and the USA (12% — about 17 ths. m³). However, in 2015, export of this type of products to the USA did not exceed 3 ths. m³.

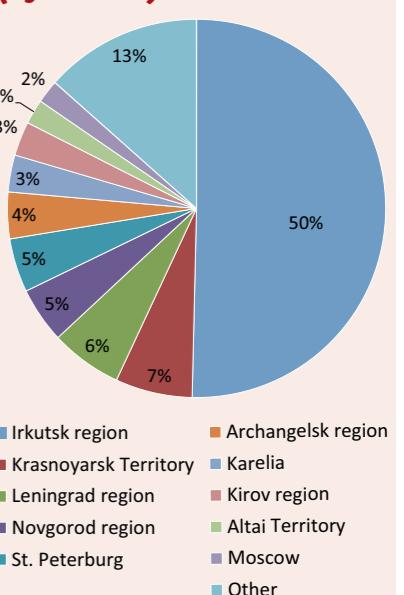

As for hardwood timber, the main purchasers are China and the Baltic States, purchasing 64% and 24% of planed birch-tree timber respectively. Along with that, China is accounted for most part of supplies of profiled birch-tree and planed oak-tree timber. Lithuania buys sawnprofiled birch-tree timber and Poland buys planed oak-tree timber.

EXPORT ROUTES OF PROCESSED TIMBER

The main stream of supplies from the Irkutsk region (up to 40% of all planed and profiled timber) is the export of planed pine-tree timber to Japan. In 2016, this volume grew up approximately by 3%, up to 470 ths. m³. This region also supplies planed pine-tree timber to Uzbekistan and China (over 70 ths. m³ in 2016), less to Korea (up to 10 ths. m³) and a little to Vietnam (over 1 ths. m³). According to the results of the end of 2016, export to China increased twofold, to Korea — half as much, to Vietnam — fourfold.

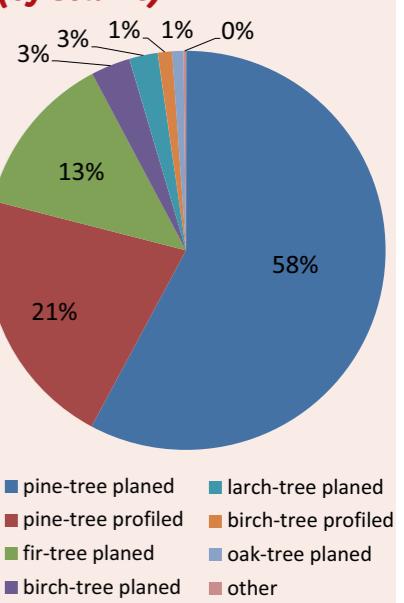

Profiled pine-tree timber is much less exported from the Irkutsk region: in 2016, delivery volume to Japan was about 5 ths. m³, to Tajikistan — 2.5 ths. m³, to Korea and Mongolia — 1-1.5 ths. m³ to each. Along with that, export of this kind of timber to Japan and Korea is going down, meanwhile the one to Mongolia and Tajikistan is growing up.

Structure of Processed Timber Export in 2016 (by Volume)

Similar to the Irkutsk region 97% of processed timber export from the Krasnoyarsk territory is planed pine-tree timber supplied to Japan — the annual stable deliveries are about 60 ths. m³. In 2016, the region started exporting the planed birch-tree to China (about 8 ths. m³ in 2016), planed larch-tree to Japan (up to 5 ths. m³). However, its profiled pine-tree volume of

Structure of Processed Timber Export in 2016 (by Volume)

supplies reduced almost twofold. It happened mostly because deliveries to Tajikistan reduced and the ones to Kirghizia stopped.

The main flow of processed timber from the Leningrad region is the planed fir-tree: over 40 ths. m³ annually. In 2016, this volume insignificantly reduced, and as the total delivery volume from the region is increasing, the share of planed fir-tree has fallen down from 70% to 40%. The primary receiver is Japan (a stable flow up to 30 ths. m³). Large volumes also go to the UK, the Netherlands, Germany and Estonia. In 2016, the export of planed fir-tree to China started — about 2.5 ths. m³ was supplied.

The second large category of export from the Leningrad region is profiled pine-tree. Its supplies in 2016 tripled and increased up to 16 ths. m³. Almost the total volume goes to Finland. The region's export of planed pine-tree (about 5 ths. m³) is stable. A half of the volume goes to Korea. In 2016, the supplies to Japan started but those to Poland stopped. The export of planed birch-tree to the Baltic States has 2.5 times increased, up to 2.5 ths. m³: the supplies to Lithuania started and those to Estonia increased.

In addition to processed softwood St. Petersburg enterprises work with hardwood as well: export of planed birch-tree timber makes one-third of the volume supplied by the city. At the same time, the volume of softwood timber is growing: supplies of planed fir-tree have tripled and exceeded 7 ths. m³. The key purchaser of these products is the Middle East: in addition to stable supplies to Kuwait (over 1 ths. m³) export to Israel jumped up (over 2 ths. m³) and supplies to Iraq started (1.5 ths. m³).

The volume of planed birch-tree supplies to Estonia and Lithuania has decreased twofold; however, export to China has doubled. As a whole, according to the results of the end of 2016, export supplies of planed birch-tree timber products significantly reduced — up to 5.5 ths. m³.

However, the supplies of processed pine-tree timber have doubled up to 4 ths. m³, mainly due to the beginning of this product export to India and Iraq and to positive dynamics of supplies to Europe.

The enterprises of the Novgorod region export profiled pine-tree and planed fir-tree timber mainly, and the most amount of timber is processed at two plants belonging to foreign investors. Supplies of planed fir-tree from the region increased by 26% and reached 24 ths. m³ due to export increase to Australia, Japan, and the USA. At the same time, major supplies to South Korea and European countries, such as Estonia, Lithuania, Germany, and Finland, reduced.

Export of profiled pine-tree timber grew up by one third, up to 22 ths. m³. The Novgorod region supplies it to Turkey (annual amount is about 9.5 ths. m³) and the USA (in 2016 delivery volume grew up twofold — almost up to 9.5 ths. m³). According to the results of the end of 2016, the increase of export volumes to Poland (over 1 ths. m³) and to Australia (about 4 ths. m³) was marked.

Export of profiled pine-tree from the Arkhangelsk region grew half as much: in 2016, it was 12.5 ths. m³. The region supplies timber mostly to CIS countries (Azerbaijan, Georgia, Moldova) and some insignificant amount goes to Europe (mostly to Slovakia).

Three companies working in the Arkhangelsk region drastically increased their export volumes of planed fir-tree to the USA (from 1 ths. to 7.5 ths. m³) and to France (from 2.5 ths. to 11 ths. m³).

According to the results of the end of 2016, the supplies of processed timber from Karelia increased from 30 ths. to 40 ths. m³; the main line is the export of planed fir-tree to the Netherlands. The sales volumes of these timber products to Finland and Japan are also growing. The region permanently exports the profiled pine-tree timber to the UK and Finland.

Last year the Kirov region started to supply planed pine-tree timber to the USA and the Netherlands. The main category of the region's export is the profiled pine-tree, but its share in the total supply volume has dropped from 93% to 76%. The profiled pine-tree export has also insignificantly reduced: the flow to Azerbaijan and Turkey has fallen by half, while supplies to Lithuania and Abkhazia have increased.

RUSSIAN PRODUCTION EXPERIENCE

Having analysed global trends, Sudoma Ltd., a relatively young Russian sawmill (a part of Dedovichi complex, located in Dedovichi, urban-type settlement, the Pskov region) decided to bet on export of deeply processed timber.

Development of export potential is a priority number one in the enterprise's strategy: over 90% of its products are intended for foreign customers. Sudoma Sawmill Ltd. produces environmentally-friendly construction materials from timber with the service life up to 100 years: planed timber, impregnated and heat-treated boards.

In 2016, while the commissioning was still in process, the enterprise had a number of contracts with foreign customers. Nowadays, the products made by Sudoma Sawmill Ltd. are in demand with the customers from European countries: Holland, France, Belgium, Greece, Lithuania, Estonia, as well as the USA and Asian countries — India and China. The main customers are Holland and France. Currently, the enterprise has the contracts for the following several months.

Monthly export volumes of Sudoma sawmill's processed timber reach 2 ths. m³. The primary product of the sawmill which is in high demand abroad is the planed timber; it illustrates the Russian export development trend. The supply volume of the products is 1.5 ths. m³. About 40% of them is the pine-tree timber, another 40% is the fir-tree, and 20% is the birch-tree timber. The enterprise's experience also reflects the trend of high demand for timber, mostly softwood, with foreign customers. The main customers of planed timber are Holland, France, the USA and India. Similar to the Russian export as a whole, the primary purchaser of Sudoma's birch-tree timber is China.

As far as impregnated timber is concerned, its monthly export volume is about 500 m³. This product category is made by Sudoma Sawmill Ltd. from pine-tree only. These materials are mainly exported to Holland and France, as well as to Belgium, Lithuania and Greece.

Since the foreign customers are getting more and more interested in the enterprise's products, its potential capacity to boost the production is stable. Sudoma Sawmill Ltd. is planning to build up production capacities and release over 61 ths. m³ of finished products in 2017. The enterprise's updated technological equipment including EWD, WEINIG, Polytechnik, Métallerie du Sud Lorrain and other global manufacturers allows it.

Vladimir Ikonnikov,
Director of Commerce, Sudoma Sawmill Ltd.

Trust but verify!

Before visiting a certain country, an experienced tourist studies the route, investigating the places of interest to be visited in the first turn, and tries to get into the mentality of the native people in that place basing on the reviews of more experienced colleagues. The route to Russia chosen by a foreign investor whose main purpose is to establish business there can be called an investment tourism. Evgeny WALTER, a founder of WALTER Group of Companies will tell about the stake price and how to choose the right guide.

Evgeny, what are the risks for the foreign investors coming to the Russian market?

In my opinion, the main risk for an investor is not in the possibility to lose the start-up capital when making a market research — this money is always under risk and one should be ready to lose it, because nobody knows what the result of the market research will be like and whether environment will be favourable for the project successful implementation. The main stake is the right and unmistakable choice of the guide — the project management team.

Not all the tourists can afford themselves a guide! But there are investors who have already had an experience in organizing and implementation of multiple big projects and there is a certain action paradigm leading to a successful result...

That is true, but let's remember that an ordinary tourist independently organizing a trip to an unknown country risks only the lack of positive emotions during the trip. But an investor risks not only his assets but his name as well. And the success of the entire project will depend on the guide chosen by the investor when he wants to get into the Russian business environment. It is not a secret that in our era of Internet it is very easy to make an image of an experienced and professional "guide" — a project manager, making an impressive portfolio, for example. Unlike Russian style of running business, the foreign one is based on trust and on a word of honour. Due to their business integrity, foreign investors often tend to believe in the image created by some project managers and hire them for very good payment without additional background checking.

What does "project manager's background checking" mean for you?

As a minimum, it means to collect reviews of the manager's work from the maximum number of participants in the projects implemented — customers, equipment suppliers, authorities, design institutes etc. The more information you have the clearer picture of the potential "guide's" real experience you will see.

Frankly speaking it is much cheaper for an investor to hire one person than a whole project team.

I would rather disagree with that. It is not the matter of the number of people in a project

team — it can consist only of one person. It is the execution of relationships that matters: either the project manager can be liable under the labour contract or the service contract — that's one thing, or the same project manager is a representative of the legal entity and then all the relationships are quite of another kind. What does a self-employed project manager risk? He risks non-payment or underpayment or does not get some fee for the services, and only after that he risks his good reputation and nothing else. There is a very low probability that the investor will upset the apple cart for this quasi-manager. What does the investor risk in case the hired project manager has failed the project? He risks his reputation and only after that he risks the big money which cannot be compared with the service payment. These things are incomparable! If we speak about relationships with a legal entity, the risks of the WALTER Company and investor's ones are comparable. Being an owner I risk my reputation first of all and the lost profit is just the second thing. A reliable company which proved its reliability has something to secure its liability to its customers. That is what foreign investors should also remember: understanding and checking what a legal entity

hired as a project team has in its portfolio is a must.

Evgeny, does it mean that you believe that only legal entities are worth dealing with, because they are the only partners to trust, and the independent project managers are not?

No, it doesn't. My main message to the potential investors who plan organizing their business in Russia is that at the stage they are building relations with companies they should be very careful. Business relations must be built on the mutual trust. That is out of question. However, the principle I am guided with is "Trust but verify!"

LESPROM-URAL Professional
Russia, Ekaterinburg

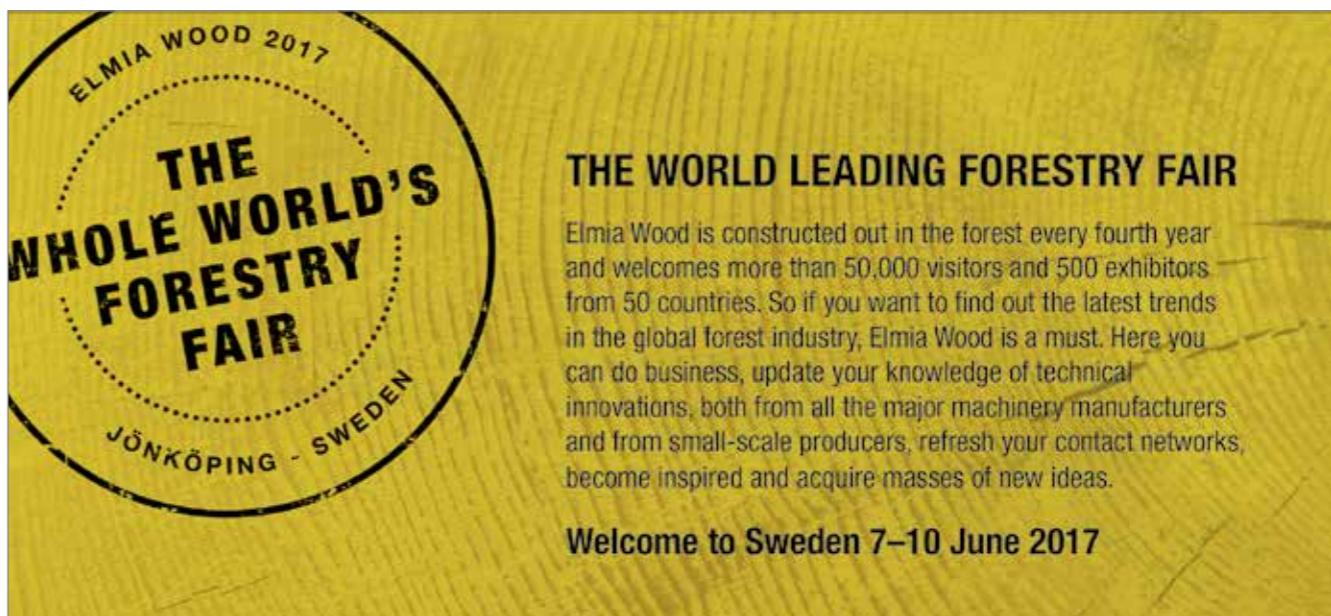

INTERNATIONAL SPECIALIZED EXHIBITION
OF MACHINES, EQUIPMENT AND TECHNOLOGIES
FOR FORESTRY AND THE WOODWORKING INDUSTRY

SPECIALIZED EXHIBITIONS WEEK

Deutsche Messe

INTERREGIONAL EXHIBITION COMPANY-URAL

GRAND EXPO-URAL

THE WORLD LEADING FORESTRY FAIR

Elmia Wood is constructed out in the forest every fourth year and welcomes more than 50,000 visitors and 500 exhibitors from 50 countries. So if you want to find out the latest trends in the global forest industry, Elmia Wood is a must. Here you can do business, update your knowledge of technical innovations, both from all the major machinery manufacturers and from small-scale producers, refresh your contact networks, become inspired and acquire masses of new ideas.

Welcome to Sweden 7-10 June 2017

Russia: Production and Export of Pellets

The past few years have been challenging for the world and the Russian pellet producers. A series of warm winters in Europe, low fossil fuel prices and a temporary stagnation in pellet demand for co-firing and full conversion power plant projects in the industrial pellet market have led to decrease of European pellet prices and depressed demand for pellets as well as for new pellet stoves and boilers. The situation changed in 2016. The first cold winter led to increase of pellet prices, as well as new political acts of supporting bioenergy in the Netherlands and other European countries led to increase of the pellet consumption. The Russian wood pellet producers answered to this interest by growing of the production and export volumes. New pellet mills have been installed in the central Siberia and north-western plants have increased the capacities.

While Russians wood pellet production is relatively young, it accounts for a 7 % share of world wood pellet exports. Russia ranks 8th in the world for total wood pellet production, with 3,5 % of total world wood pellet production. According to INFOBIO, production of wood pellets in Russia is forecast to increase significantly by 4 MMT by 2020, and 8 MMT by 2025.

Currently, Russia is the third largest exporter of wood pellets to the European Union, after the

Pellet Export Shipment by Sea, Truck and Railway, Jul-Dec 2016 According to Incoterms

United States and Canada. According to Rosstat (Russian Federal Statistical Service), Russia produced 1,07 MMT of wood pellets in 2016, a 10 percent increase from CY 2016.

A vast majority of export accounts for the sea shipment. The main export ports are the Saint-Petersburg port, the Vyborg port, Vanino, Arkhangelsk, and Ust-Luga ports. Besides, sea shipments are made on terms "FCA – Russian place of dispatch", which complicates the identification of certain ports, however we can assert that the main port used is the port of Saint-Petersburg.

Traditionally, the leading countries that buy wood pellets in from Russia are Denmark and Sweden. The Southern Korea takes the third place in the rating of importers of Russian pellets due to the active efforts of "Arkaim" JV.

Germany, the Netherlands and Italy open the second group of countries – importers of Russian pellets – and take the 4th, the 5th and the 6th places in the import rating accordingly. Followed by Finland, Latvia and Great Britain.

There are also other countries which buy some pellets from Russia every year.

The biggest exporter of pellets "Arkaim" JV is located in Khabarovsk region and produces about 125,000 MT per year. The second biggest producer CJSC "Lesozavod 25" is situated in Arkhangelsk region and the third DOC Enisei LLC is in Siberia. There are big pellet mills in different Russian regions from Far East and Siberia till North-West. However, experts consider that there are 6 major export oriented provinces in Russia that account for almost 80-90 % of Russia's total wood pellet exports.

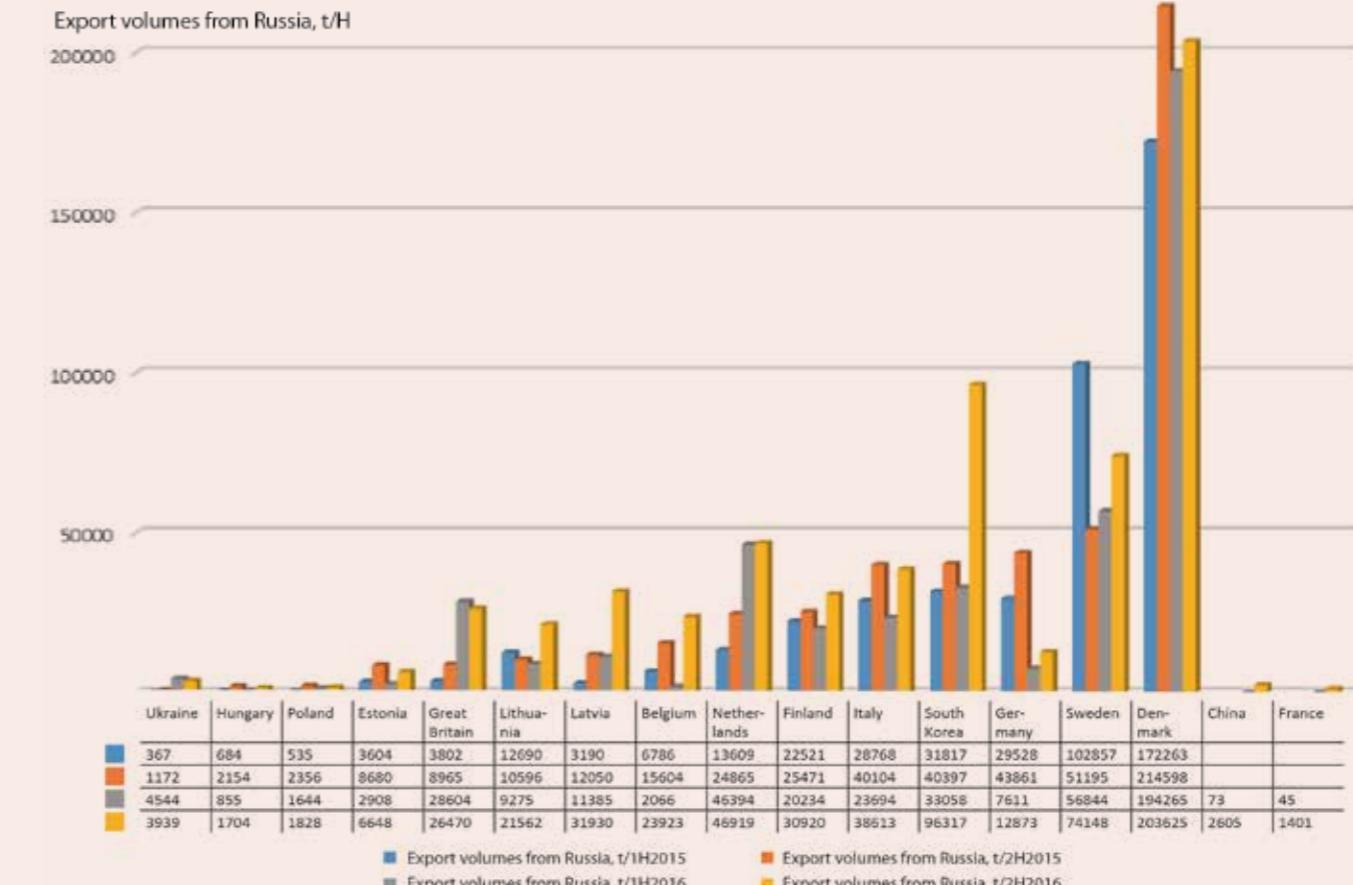

While Vyborg Forestry Development Corporation from the Leningrad region has a capacity of 1 MMT, it produces not more than 5 % of it. You can see the production and export volumes of Russian companies in the table below. 95 % of produced pellets are exported in from Russia. There is no internal consumption of this product in the Russian market. The growing interest from the European Union for biofuels, particularly wood pellets, will continue to be a major incentive for Russia to increase production of wood pellets.

Most Russian pellet producers export wood pellets class ENplus A1, issued by AEBIOM - European Biomass Association that is in compliance with the EU standard. Industry reports that about 30 large Russian pellet producers are certified by ENplus and by SBP (Sustainable Biomass program) in 2016.

Europe will continue to be the largest importer of Russian wood pellets in the near future. Russia has export potential and European pellet demand will continue to stimulate an increase in Russian production. Due to the Rouble devaluation since 2014, a number of smaller wood pellet producers were able to start exporting their products to the EU, in spite of previous logistics barriers. However, exports from these facilities will be limited by increasing requirements from the EU in certification. At the same time, Asian traders from Japan, China and other countries are very active in finding reliable partners in Russia and sign long-term contracts with Siberian and Far East Russian pellet plants.

§ Competitiveness of Russian Birch Plywood Producers

Russian birch plywood industry is gaining momentum in global birch plywood market. Western producers should by now get cold feet. The industry has all the prerequisites in place to become the leader in global business. Raw material and labour costs are still relatively low, and export sales are fueled by weak RUB. However, productivity and efficiency of the Russian producers are significantly lower than of the Western competitors. Increasing oil price and accompanying revaluation of RUB may be lurking behind the corner. Moreover, rapidly increasing input costs, such as labour and raw material costs in local currency, are a threat for losing competitiveness on the Global market. Some companies adjust their operations already, whereas other players take the current situation for granted. Long-term competitiveness of Russian industry depends on the operations efficiency. Thus, the industry needs more accurate metrics for performance monitoring and process streamlining in order to flourish.

Russian birch plywood producers

PRODUCTION OF PLYWOOD IN RUSSIA: CURRENT STATE

Plywood production in Russia has demonstrated constant growth in recent years, especially in birch. On a global scale, softwood plywood production is on the rise. However, this trend is not evident in the Russian plywood sector. Coniferous plywood production accounts only for about 3% of total production output.

Traditionally birch plywood production has been concentrated in the European part of Russia. Some mills have adapted their production technologies to foreign market needs, while others are still relying on the domestic market. From product point of view, this means that export oriented companies produce 4x8 and 5x10 formats and home market focusing companies stick to production of UF bonded 5x5 size.

INVESTMENTS IN BIRCH PLYWOOD PRODUCTION

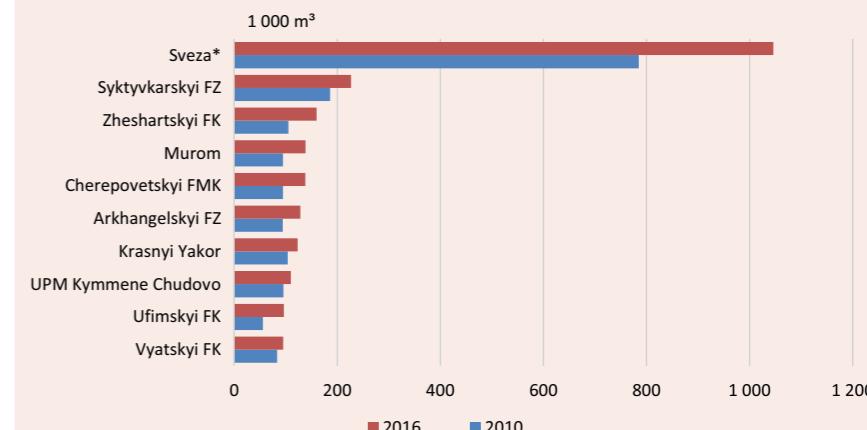

Export-oriented Russian plywood producers appear to be most willing to invest in expansion of production capacities and more value-added products. The most notable announced capacity expansions are executed by Segezha and Sveza Groups. Segezha's Vyatka plywood mill will double its annual production capacity to 180,000 m³ by second half of 2017. Additionally, the company plans another greenfield mill in Sokol, Vologda area. Sveza Group has informed that they will increase production volume in its existing Kostroma and Uralskiy mills. In future, both new mills and upgrades of existing ones are expected. In November 2016, Polish plywood manufacturer Paged Group announced a plan to invest in a greenfield birch plywood mill in Novgorod region. Planned production capacity will be 120,000 m³ annually.

Like Russian producers, European plywood producers also invest in new capacities, namely in the Baltic States. On 15 November 2016, Latvijas Finieris opened a new birch plywood

Production of plywood in Russia

Top 10 birch plywood producers in Russia

Source: Pyrabelisk

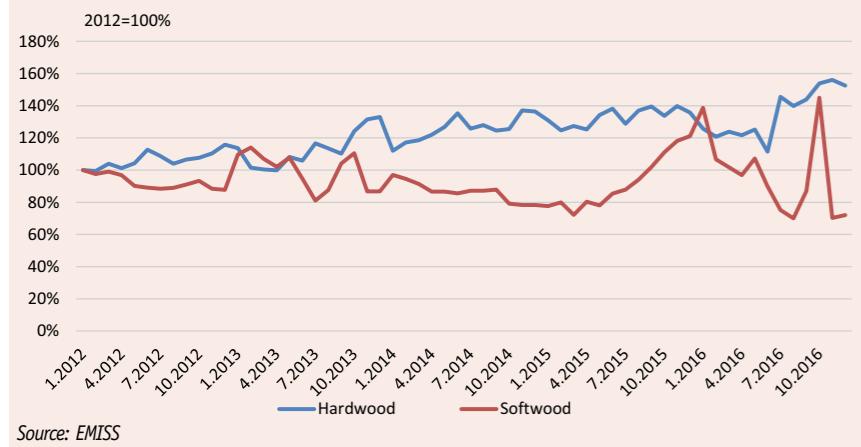

Note: In 2010 Sveza had a different company structure. In 2012, Sveza acquired Fankom plywood factory in Sverdlovsk region. Currently this factory is called Sveza Verhnaya Sinyachiha.

Investments in birch plywood production

Company	Location	Schedule	Scope of Investment	Additional Capacity
RUSSIA				
Segezha Group	Kirov	Second quarter of 2017	Log handling, two veneer peeling lines, two veneer drying lines, two veneer composing lines, automatic veneer patching line, two plywood lay-up and pressing lines, plywood edge cutting, putting and overlaying lines + automatic veneer patching line and an overlaying line	+83,000 m ³
Segezha Group	Sokol, Vologda region	n/a	Greenfield mill	126,000 m ³
Sveza	Kostroma	2018	Expansion	+70,000 m ³
Sveza	Uralskiy, Perm region	2020	Expansion	+50,000 m ³
Orion	Udmurt Republic	2019	Greenfield mill	25,000 m ³
Cherepovetsky FMK	Cherepovets, Vologda region	End of 2016	Expansion	+40,000 m ³
Paged Group	Novgorod region		Greenfield mill	120,000 m ³
OTHER				
Metsä Wood	Äänekoski, Finland and unknown location, Estonia	End of 2018	New birch veneer peeling and drying line to Äänekoski. New plywood mill is to be constructed in Estonia. Finnish Suolahti mill's current birch veneer line is to be transferred there.	+30,000 m ³

Veneer logs cost in Russia, 2012–2016

mill in Estonia. The company has expanded Kohila veneer plant to a full-scale plywood mill. The expanded capacity will reach 45,000 m³ of birch plywood per year. Less than a week earlier, UPM inaugurated mill expansion and the new bio boiler plant in Otepää, Estonia. The expansion increases the mill's annual production capacity to 90,000 m³. The Finnish company MetsäWood has done a preliminary agreement on buying industrial site located in Pärnu, Estonia. The agreement is related to the new plywood mill in Estonia, where the company plans to convert birch veneers manufactured at the new peeling and drying line in Äänekoski, Finland into plywood on the converting line which will be transferred from Finland to Estonia. MetsäWood is still in the process of choosing the mill location between two options: Pärnu and Tartu, but the final decision regarding the mill is yet to be made.

RAW MATERIAL RESOURCES

Typically birch plywood producers do not rent forests but source veneer logs from market. Own forest lease areas would increase birch plywood producers' self-sufficiency and independency in birch log sourcing. The utilization rate on attractive, economically feasible volumes is currently 80%. Therefore, new volumes come with higher costs, complications and risks. Lack

of infrastructure makes additional wood volumes sourcing challenging. Clear wood procurement procedures would open up opportunities, increase transparency and benefit log sourcing.

In recent times, Russia has substantially increased birch veneer log exports while the respective imports are close to non-existent. At the same time, birch veneer log prices keep increasing. Within this context the Russian plywood enterprises face a significant raw material deficit. On October 27, 2016, the Ministry of Industry and Trade of Russia proposed to temporarily restrict exports of birch veneer logs due to the deficit of domestic raw material for production of plywood. The draft decree was published on the Federal Statutory and Regulatory Enactments Portal of Russia.

RUSSIAN BIRCH PLYWOOD INDUSTRY DEVELOPMENT

Prices for veneer logs in Russia are steadily increasing. The actual price the mills are paying for good quality birch veneer logs may be considerably higher than that given by the official data. Due to raw material scarcity, some mills have secured the supply of veneer logs by reducing block diameter. Nevertheless, wood cost in Russia is still considerably lower than

in competing regions. Between Finland and the Baltics birch logs mill gate prices are rather identical. For example, stumpage price in Estonia is lower than that one in Finland, but higher harvesting and transportation costs result in similar actual delivered wood prices.

Along with relatively low veneer logs cost in comparison with Finland and the Baltics, Russia has a strong competitive advantage in labour costs. At present, average salary in the Russian veneer and plywood industry is slightly below 30,000 RUB per month. In comparison, monthly wages and salaries in typical Finnish and Baltic birch plywood mills are 245,000 RUB (3,500 EUR) and 125,000 RUB (1,800 EUR), respectively. (RUB/EUR 70)

However, on the average, one blue-collar worker produces ca. 60 m³ p.a. In comparison, annual labour productivity in typical Finnish and Baltic birch plywood mills are 220 m³ and 250 m³, respectively. Between 2010–2015 labour productivity increased by 36% whereas the number of workers has remained nearly the same.

Cost structure comparison between Russia, the Baltic States and Finland. The costs of the Finnish birch plywood producers is estimated to be more than threefold compared to typical Russian producer. In Finland, high labour costs have driven the production towards more value-added products, i.e. special specifications in custom sizes and/or with special surfaces, and higher level of automatization.

PLYWOOD EXPORTS

For Russian manufacturers favorable currency development has enabled prominent increase of export volumes, especially to USA, Europe and North Africa. The price competitiveness of Russian birch plywood increased dramatically in the second half of 2014 due to the sharp fall in the value of the Russian rouble. At the same time, domestic demand for plywood products, especially filmed plywood grades in Russia has been weakening. However, average export prices in EUR have dropped from as high as 500 EUR/m³ in the end of 2014 to as low as 370 EUR/m³ in July 2016. During the same period of time, the Western producers did not experience price decreases, despite seasonal price volatility.

In distribution channels Russian birch plywood industry still relies heavily on importers and other intermediaries. Through direct sales to end users the producers could achieve more independence in pricing. Both channels are necessary to maintain and develop as standard products are distributed by traders as more value-added products are often sold directly to end users. A combination of direct sales and importer sales can be used to smoothen out price and demand volatilities. Building up direct sales relationships to industrial customers is a long-term process. In order to meet future sales requirements and toughening competition, Russian birch plywood producers' sales and marketing organizations must be strengthened

significantly. A shift from product focus to providing customer with added value should take place. This will allow premium pricing and better profitability through service packages, and increased customer loyalty.

Construction is the largest end-use for birch plywood in Europe, but transport sector has a significant role in the largest consumption countries. Over half of the total demand in the largest consuming countries expected to be laminated/film-faced panels.

Plywood key segments are still recovering from steep decline in 2007–2008. Growth outlook is positively based on continued cyclical recovery in most key segments, coupled with largely positive application trends and limited evidence of substitution.

The recovery of the European construction sector is driving plywood demand (annual growth 2–3% p.a.). Formwork has been assumed to grow in line with the outlook for general industrial output. Parquet consumption is largely driven by residential construction.

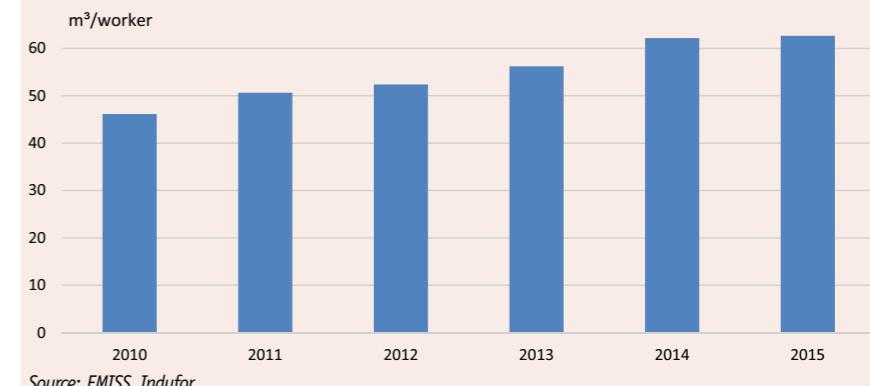

Key commercial vehicle segments (trailers and light commercial vehicles) witnessed steep decline in 2009 stemming from the general economic downturn. The financial crisis created a backlog for trailers driving the current replacement need (average growth 4% p.a.).

LNG tanker building was heavily depressed during the crisis due to overcapacity during the down market driven by speculative buying pre-2008. Now the LNG market is expected to remain solid as countries secure energy availability, thereby supporting the demand for LNG vessels. Existing orderbook for plywood based LNGC is approximately 100 vessels. In October 2016, Sveza Ust-Izhora plywood mill obtained the GTT (Gaztransport & Technigaz, France) approval confirming compliance with specification of containment system for liquefied natural gas (LNG) carriers. Sveza has become the first Russian domestic producer certified to deliver birch plywood to membrane-type LNG carriers manufacturers. The company aims at supplying the estimated annual volume of 60,000 m³ of birch plywood, which represents 30% share of the market. Sveza Group is the fourth company in the world certified by GTT, other three are UPM, MetsäWood and Latvijas Finieris.

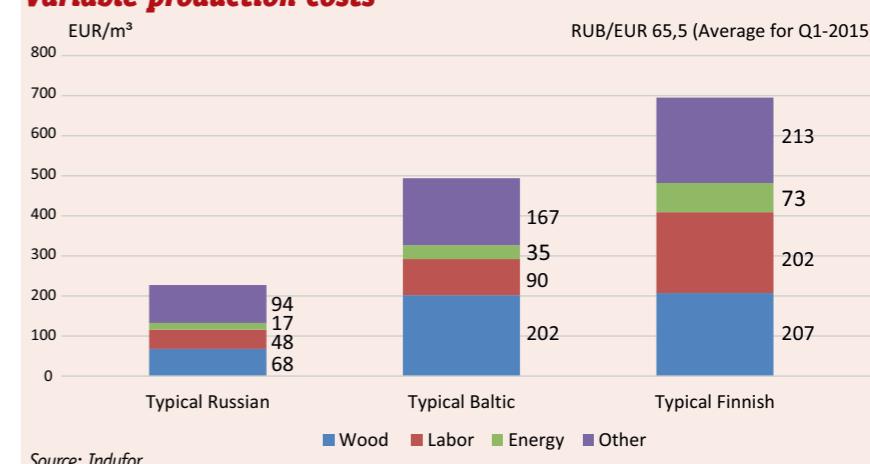

CONCLUSIONS

Russian plywood producers have numerous competitive advantages in comparison with other producers, such as wood raw material and labour costs. However, productivity per worker is still at low level compared to Scandinavian and Baltic producers. Competitive situation can be improved by new investments, which along with modernization are needed to maintain Russia's birch plywood industry's competitiveness when Russian Rouble strengthens again. It is a must for Russian producers to improve their efficiency if they want to keep their competitive position on the Global market in the future.

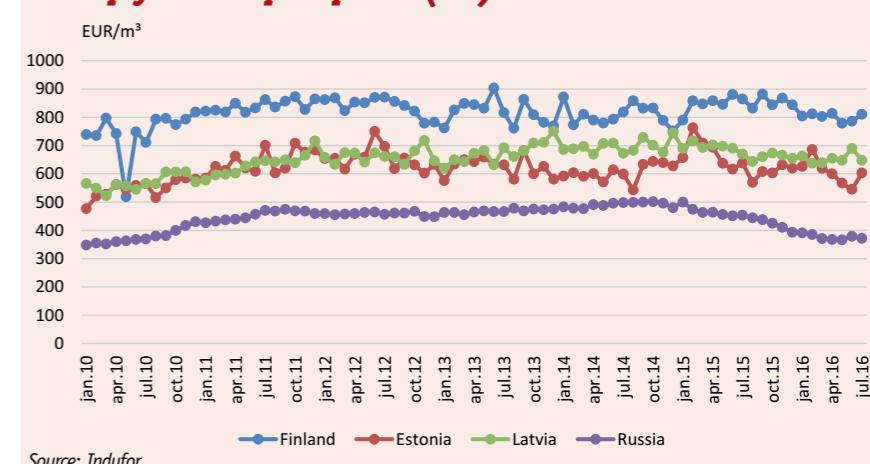

Labour productivity, 2010–2015

Variable production costs

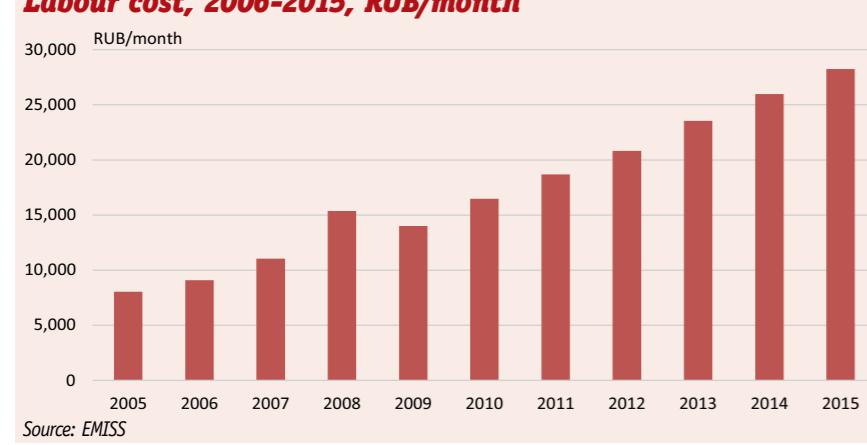

Birch plywood import prices (CIF) in the EU

Increasing input costs and tightening domestic competition between birch plywood producers put pressure on companies' operational improvement. The industry would certainly benefit from industrial benchmarking which aims at comparing a company's or mill's performance relative to its peers in order to find out firstly, where the performance gaps are and secondly, how significant they are. Benchmark would provide guidance in which

areas the strategic initiatives should be taken for improving company's competitiveness. Benchmarking participants make better-informed decisions and thrive because they have reliable and consistent measures of their performance compared to the broader market. Such tool is under development and will be implemented in the near future.

Labour cost, 2006–2015, RUB/month

The Wood Based Panel Business in Russia: Opportunities Ahead

The wood based panel business in Russia is diverse: dynamic, export oriented and growing for plywood; fast growing at the expense of other wood products in the domestic market for OSB; struggling through oversupply, low margins and low demand for particleboard; growing but through low margins and low demand in MDF.

Wood based panel types globally are very diverse in terms of maturity of the product, production volumes and the key end-uses. Russia is no exception here: the largest production volumes are seen for mature products (plywood, particleboard, MDF); some wet-process fiberboard lines are still operational but the volumes decline with deterioration of the state of the existing lines; new products grow fast but from relatively low levels (OSB, LVL).

On the Fig. 1, wood based panels are highlighted with orange color and shown

among other forest industry products. Plywood, particleboard and wet-process fiberboard (both hardboard and softboard), theoretically, reached the decline phase. However, the future of those products is likely to be rather different: for plywood and particleboard there is a "product extension" period, "provided" mostly by sustainability trend on the demand side. We can compare it with present state of bicycles in developed countries: the maturity period is way over, while the new "product extension" wave is still there, powered by

sustainability and staying-healthy trends on the demand side.

Let us have a closer look at the products in the wood based panel family.

PLYWOOD: THE MOST EXPORTED

The most exported wood based panel type in Russia is plywood: the export grew from some 2.2 million m³ in 2015 (2.0 in 2014) to some 2.5 million m³ in 2016. Over 90% of the volume was white and surfaced birch plywood, the rest

being LVL and softwood plywood in almost equal shares. The share of export grew from 59% in 2015 (55% in 2014) to 65% in 2016. Such a high share of export was previously seen in late 1990s and early 2000s (1995: 71%, 2000: 65%; 2005: 59%). Of course, back in those days the export volume was much smaller: 0.67 million m³ in 1995, 0.96 million m³ in 2000, and up to 1.5 million m³ in 2005.

There are four main reasons for such an impressive development recently:

- Russia is among a few regions on the planet to sit on large volume of birch logs, and that gives a natural advantage to domestic producers
- A drop in the exchange rate of Russian ruble against USD in late 2014 gave a large boost to competitiveness of Russian plywood producers
- The demand for birch plywood at the main export destinations (EU and the US) remains strong
- The demand for plywood in Russia is under pressure both from generally weak economic performance of the country and rising domestic production of OSB, which pushes larger volumes to the export

The overall economic situation in Russia is likely to remain weak in mid-term perspective, with GDP development significantly slower than the global average (see Fig. 2, source: IMF World Economic Outlook, April 2017). Basically, any large region on the planet is forecasted to develop faster than Russia in 2017-2020. To make it sound even more depressing, let's

Fig. 2: Real GDP growth, cumulative change, 2016 level as 100%

Real GDP growth, cumulative change, 2016=100%	2016	2017	2018	2019	2020	2021	2022
Emerging and Developing Asia	100.0	106.4	113.2	120.3	127.9	136.0	144.5
Sub-Saharan Africa	100.0	102.7	106.3	110.1	114.2	118.4	123.0
Middle East and North Africa	100.0	102.3	105.6	109.0	112.5	116.4	120.4
Australia and New Zealand	100.0	103.1	106.2	109.3	112.3	115.5	118.6
North America	100.0	102.2	104.7	106.9	108.9	110.8	112.8
South America	100.0	100.6	102.4	104.7	107.2	109.7	112.4
European Union	100.0	102.0	103.8	105.7	107.6	109.4	111.3
Russian Federation	100.0	101.4	102.8	104.4	105.9	107.5	109.1
World	100.0	103.5	107.2	111.2	115.3	119.6	124.1

base case scenario assumes GDP development close to the forecast by IMF (Fig. 2), with different weight for new production projects depending on their probability. In every case, the capacity utilization is assumed to grow from some 50% of the nameplate capacity in the first 12 months of production up to 100% in the fourth year.

On the other hand, the key export markets for Russian export oriented forest industry products are forecasted to grow faster than the growth of the Russian economy: Asia, MENA, North America, EU.

Top-3 export destinations for Russian plywood are stable over the recent years: Egypt, the United States and Germany. Those three accounted for some 36% of the total Russian plywood export in 2016 (35% in 2015, 36% in 2014).

The production is likely to continue to grow relatively fast: up to some 4.2 million m³/a by 2020 in the base case scenario (Fig. 3). The

It is worth noting that all (!) new plywood production projects in Russia are targeting export markets, and (almost) all of them aim

Fig. 1: Position of wood-based panels among other forest industry products

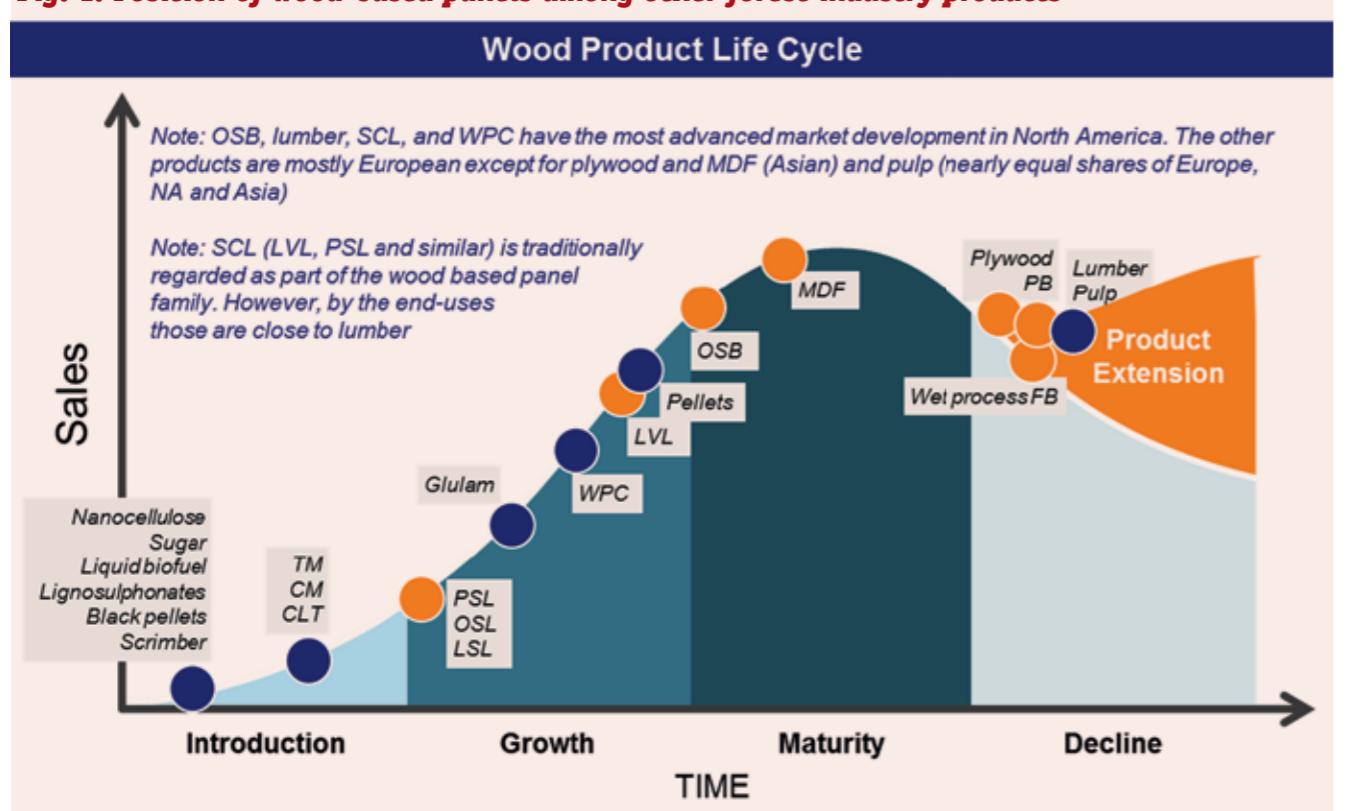

Fig. 3: Russian plywood production, consumption and net-export, 2000–2020, base case scenario

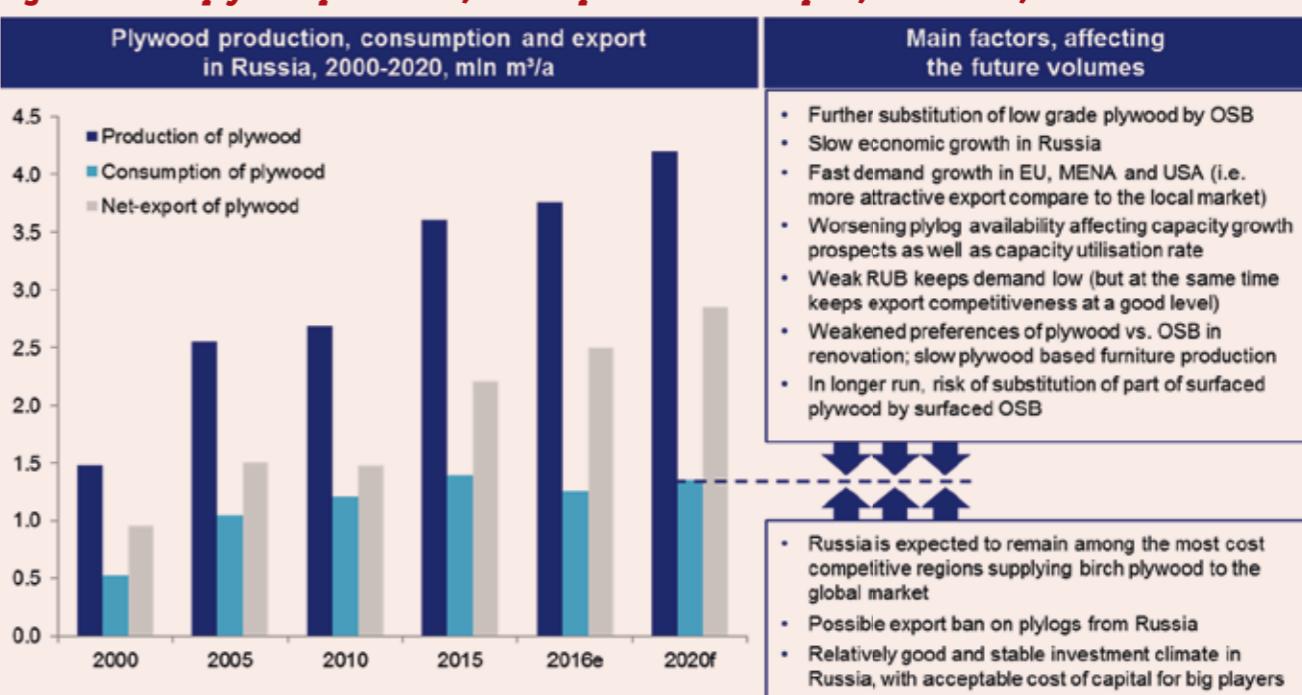

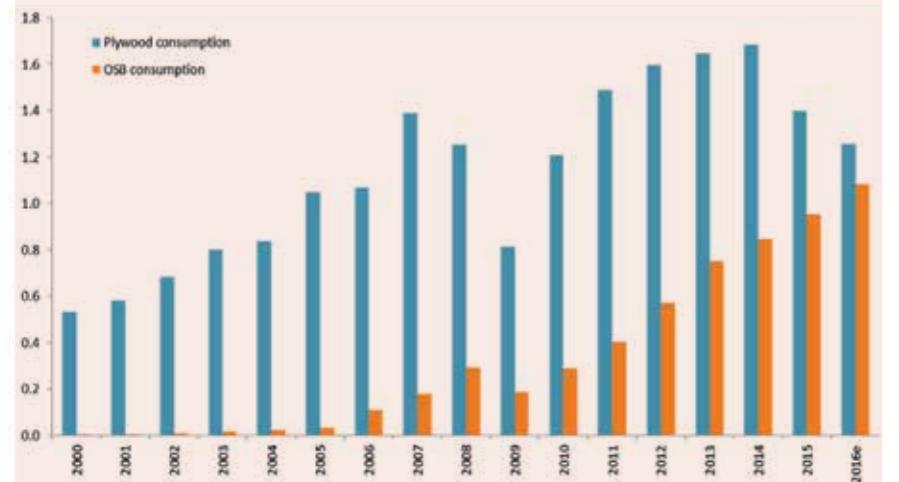

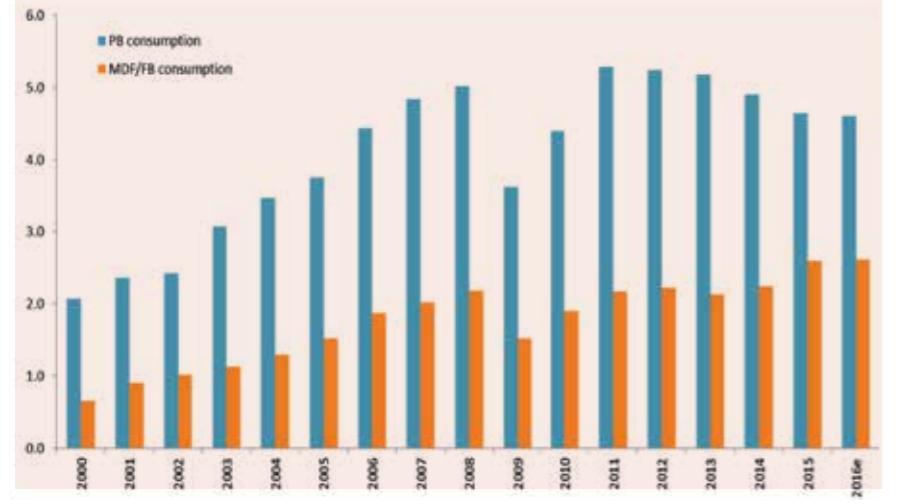

Fig. 4: Russian plywood and OSB consumption, million m³/a**Fig. 5: Production of OSB, large and small size plywood in Russia, 2000–2020f, million m³/a, base case scenario****Fig. 6: Particleboard consumption vs. MDF/FB consumption in Russia, 2000–2016, mln m³/a**

to produce large size birch plywood (4x8, 5x10 and similar). The main reason for that is the fact that domestic sales are likely to remain under pressure from weak demand, weak ruble and growing OSB production in the country. So, export remains the most profitable option, in spite of oversupply and lowering margins at key export destinations recently (average plywood prices from Russia "as reported" to go down by 35% in 2016 compared to 2014, in US dollars).

OSB: THE FASTEST GROWING

The fastest growing segment in the Russian wood based panel sector is OSB production. Since late 2012, OSB started to be produced in Russia. Just several years since the first board, OSB is being produced at six mills, three of them with over 200,000 m³/a capacity each. One more large size mill is likely to come on stream in 2017–2018 (Kronospan Ufa, capacity 500,000 m³/a), and one more might double the effective capacity by debottlenecking (Kalevala, capacity of the main press at 500,000 m³/a, capacity of the pre-press machinery at 300,000 m³/a).

Most of the panels are sold domestically. Even though the domestic production soared, Russia remains net importer of OSB: in 2016, some 0.4 million m³ of OSB was imported with export close to zero. Over 75% of the import came from Belarus, from the new 600,000 m³/a capacity Kronospan mill in Mogilev.

OSB consumption is growing rapidly, with average prices pushed down by the domestic producers. OSB substitutes low grade plywood as well as low grade sawn wood in applications like renovation (sub-flooring and similar), construction, packaging, fences and auxiliary buildings. Furniture, formwork and transportation remain plywood consumption strongholds in Russia, but those are not big enough to keep the sales stable. In the base case scenario for 2017–2018, OSB consumption in Russia is forecasted to exceed domestic plywood consumption. And this situation is expected to persist both in mid-term and in long-term perspective (Fig. 4).

On the production side, the story of plywood vs. OSB is a bit different (Fig. 5). OSB production is likely to remain below plywood production in Russia in any foreseeable future. Production volumes of large size plywood are likely to grow (with most of the extra volume to be exported) while 5x5 plywood production is likely to stagnate (base case scenario). In this scenario, domestic OSB production might surpass the 5x5 plywood production somewhere in 2020–2025 but would remain far behind the total plywood production in Russia.

PARTICLEBOARD: THE DORMANT GIANT

The largest volumes in terms of production and consumption in Russia are seen in the particleboard business. Since 2011, particleboard production volumes in Russia were nearly flat at some 5.5

A PERFECT FIT

solutions around the globe for wood processing machinery

Choose the right partner
for the production of top quality
wood-based products

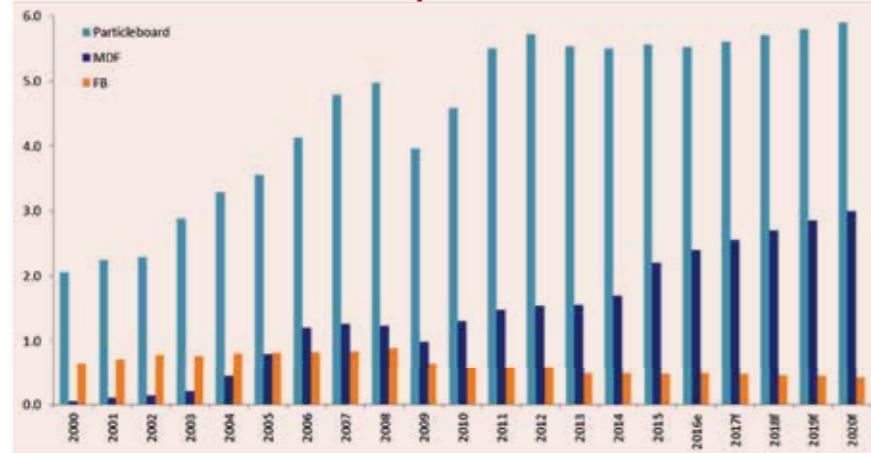

The Group has spent the last few years developing and investing in forming and continuous press technology to complete its range of products and to become a reliable and competitive

partner for the supply of complete lines for the production of PB, MDF, OSB, insulation board, pellets, pallet blocks, pressed pallets as well as biomass energy and waste treatment.

GROUP

Fig. 7: Particleboard, MDF and wet-process FB production in Russia, 2000-2020, mln m³/a, base case scenario

5.7 million m³/a while the consumption volumes declined from some 5.3 million m³/a in 2011 to some 4.6 million m³/a in 2016 – following decline in furniture production. The largest furniture companies in Russia were able to keep the volumes stable throughout the crisis (but not the prices) while smaller companies decreased the volumes; as a result we saw some 7-8% drop in industrial furniture production in Russia two years in a row.

The official statistics in Russia show slightly different picture of particleboard production: an almost uninterrupted production growth in the country up to some 6.5 million m³/a produced in 2016, and close-to-stable apparent consumption. It should be noted that the official statistics is reporting "conventional" m³ (a remnant of the Soviet times aim to take into account different thicknesses), and the production volume includes OSB.

Consumption of particleboard in Russia is shown on the Fig. 6, together with cumulative MDF+FB consumption. At first glance, the decline in particleboard consumption might look counter-intuitive at the background of growth of MDF+FB consumption, more on that later.

In spite of the recent decline in consumption, particleboard remains the most consumed wood based panel type in Russia – and this is likely to continue in the foreseeable future. The volumes

remain large to justify further investments in the production, and the investments can bring return even in the current tough market conditions, assuming the production is competitive against at least majority of the other capacity in Russia (which is not extremely hard, as over a third of particleboard production capacity in Russia is 35 years old and older).

MDF: MANY WAYS TO GROW

MDF consumption in Russia is growing at a slow-but-steady pace through the crisis. The main reason for that is growing domestic laminate flooring production (close to 70 mln m³/a in 2016, with some 30 mln m³/a growth in the last 5 years). The other large and growing industrial end-use segment for MDF is production of doors (cumulative growth of some 20% in the last 5 years). Furniture production is declining, but the decline is not big enough to lead to overall decline in MDF consumption.

Another declining segment for MDF/FB group (see Fig. 6) is consumption (and production) of wet-process fiberboard. The main end-use segments here are furniture, renovation (sub-flooring) and packaging. However, here the volumes are also relatively small to affect the overall trend (production at some 0.5 mln m³/a in 2016; consumption at some 0.4 mln m³/a

in 2016; decline of some 20 ths m³/a in 2011-2016 both for production and consumption). The overall trend is the same as we see in many other countries: thin MDF/HDF substitutes the wet-process fiberboard, especially in furniture applications.

It is expected (base case scenario) that both particleboard and MDF production will grow in Russia in 2017-2020, while production of wet-process fiberboard will continue to decline. MDF production capacity in Russia has grown quite dramatically since 2014: two lines of Kastamonu Entegre in Elabuga, one line of Egger in Gagarin, one line of PDK Apsheronsk in Apsheronsk – with overall incremental capacity of some 1.6 million m³/a. Two more lines are likely to start in 2017-2018: Russian Laminate in Igorevskoye (construction phase) and Roskitinvest in Asino (test period). Just those two lines would add 0.6 million m³/a – which would make overcapacity in the country practically inevitable, even taking into account some export opportunities. In relation to this situation, the particleboard capacity utilization might be much healthier in 2018-2020, assuming some more old lines would stop for good in 2017-2019.

OTHER SCENARIOS

The forecasted development described in the article is just one of many possible scenarios. The level of unpredictability in Russia remains very high, and the calculation results for other scenarios differ substantially. More comprehensive picture on the future development in terms of volumes and prices can be obtained by direct comparison of the situation in Russia with what was seen in the past in other countries, or by modelling the development using supply-demand models like Zeno model developed by Pöry*. Both can help strategic decision making, and not only in Russia.

*Alexey BESCHASTNOV, Senior consultant,
Pöry Management Consulting*

* Zeno is the first linear optimization supply-demand model specifically developed for the wood based panel industry using Pöry's comprehensive industry and market databases to test alternative scenarios for the future industry and market development.

Global leader in forest industry consulting

Pöry has nearly 60 years of experience in consulting and engineering for the forest industry worldwide. Our consulting services cover the entire business lifecycle – from strategic consulting to operational services. With offices in 40 countries, Pöry provides global experience and local knowledge to help your business prosper.

Pulp and Paper Industry of Russia in brief

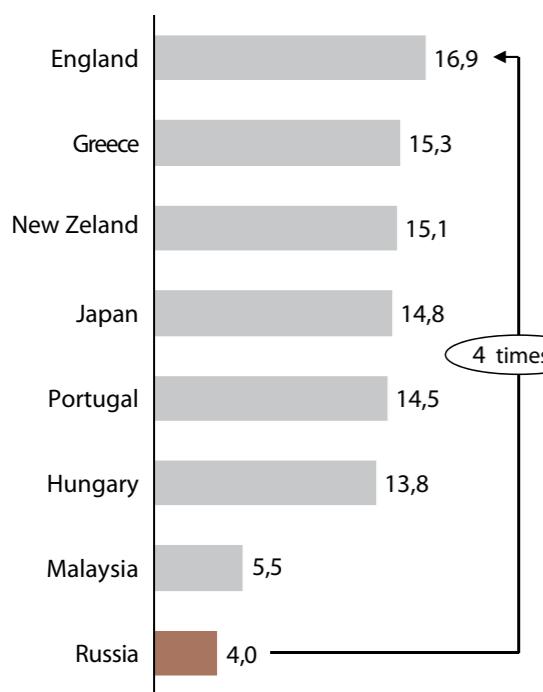

Strategy of pulp and paper industry till 2030

- Development of big export potential of cellulose (incl. viscose pulp) by Russian companies at Asian markets
- Keeping high potential of import substitution of high value-added products
- Development of consumption of tissue, packaging and recycled cardboard at domestic market

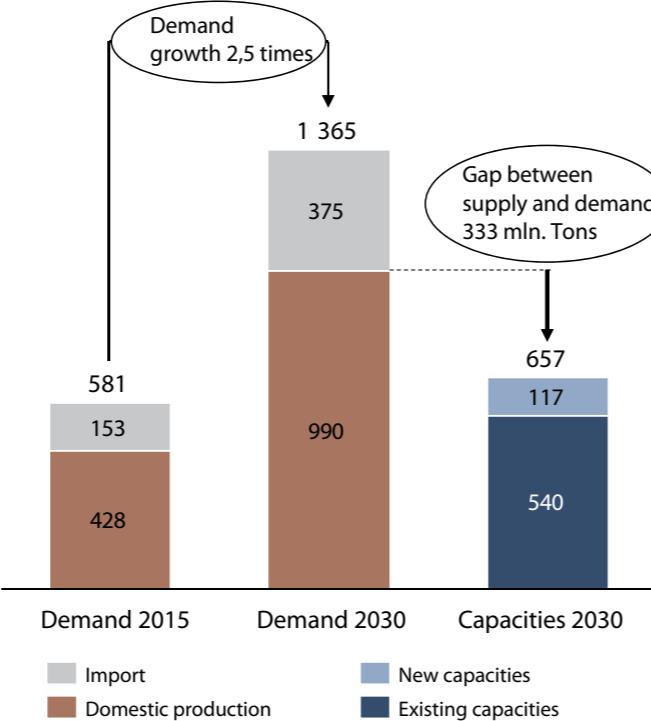

Production of paper and cardboard, mln. t.

Difference of tissue consumption by country, kg per person

Prognosis of demand and supply of tissue at Russian market, mln. Tons

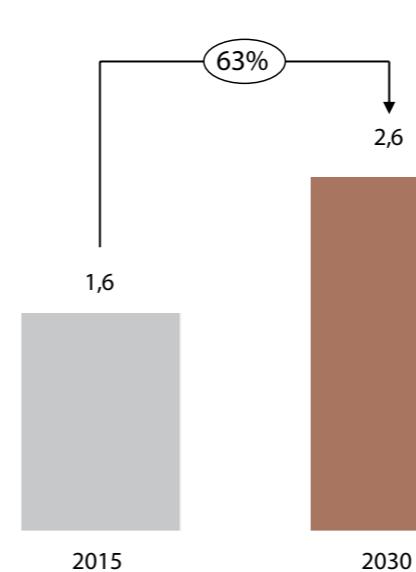

There are high potential for import substitution of high value-added products in Russia

Main product types	Import, th. tons		Import, mln. USD		Share of import in total consumption value, %
	2014	2015	2014	2015	
Writing paper	302	190	277	148	23% 16%
	136	74	122	51	18% 10%
Packaging paper and cardboard	1	3	1	2	0,1% 0,2%
	82	83	44	36	5% 5%
Consumer cardboard	389	369	431	345	32% 34%
	16	20	20	18	7% 13%
Tissue	88	48	157	82	19% 8%
	920	1 164	1 166	784	
Total					

Growth of packaging cardboard market in Russia, mln. t.

Growth of recycling cardboard market, mln. t.

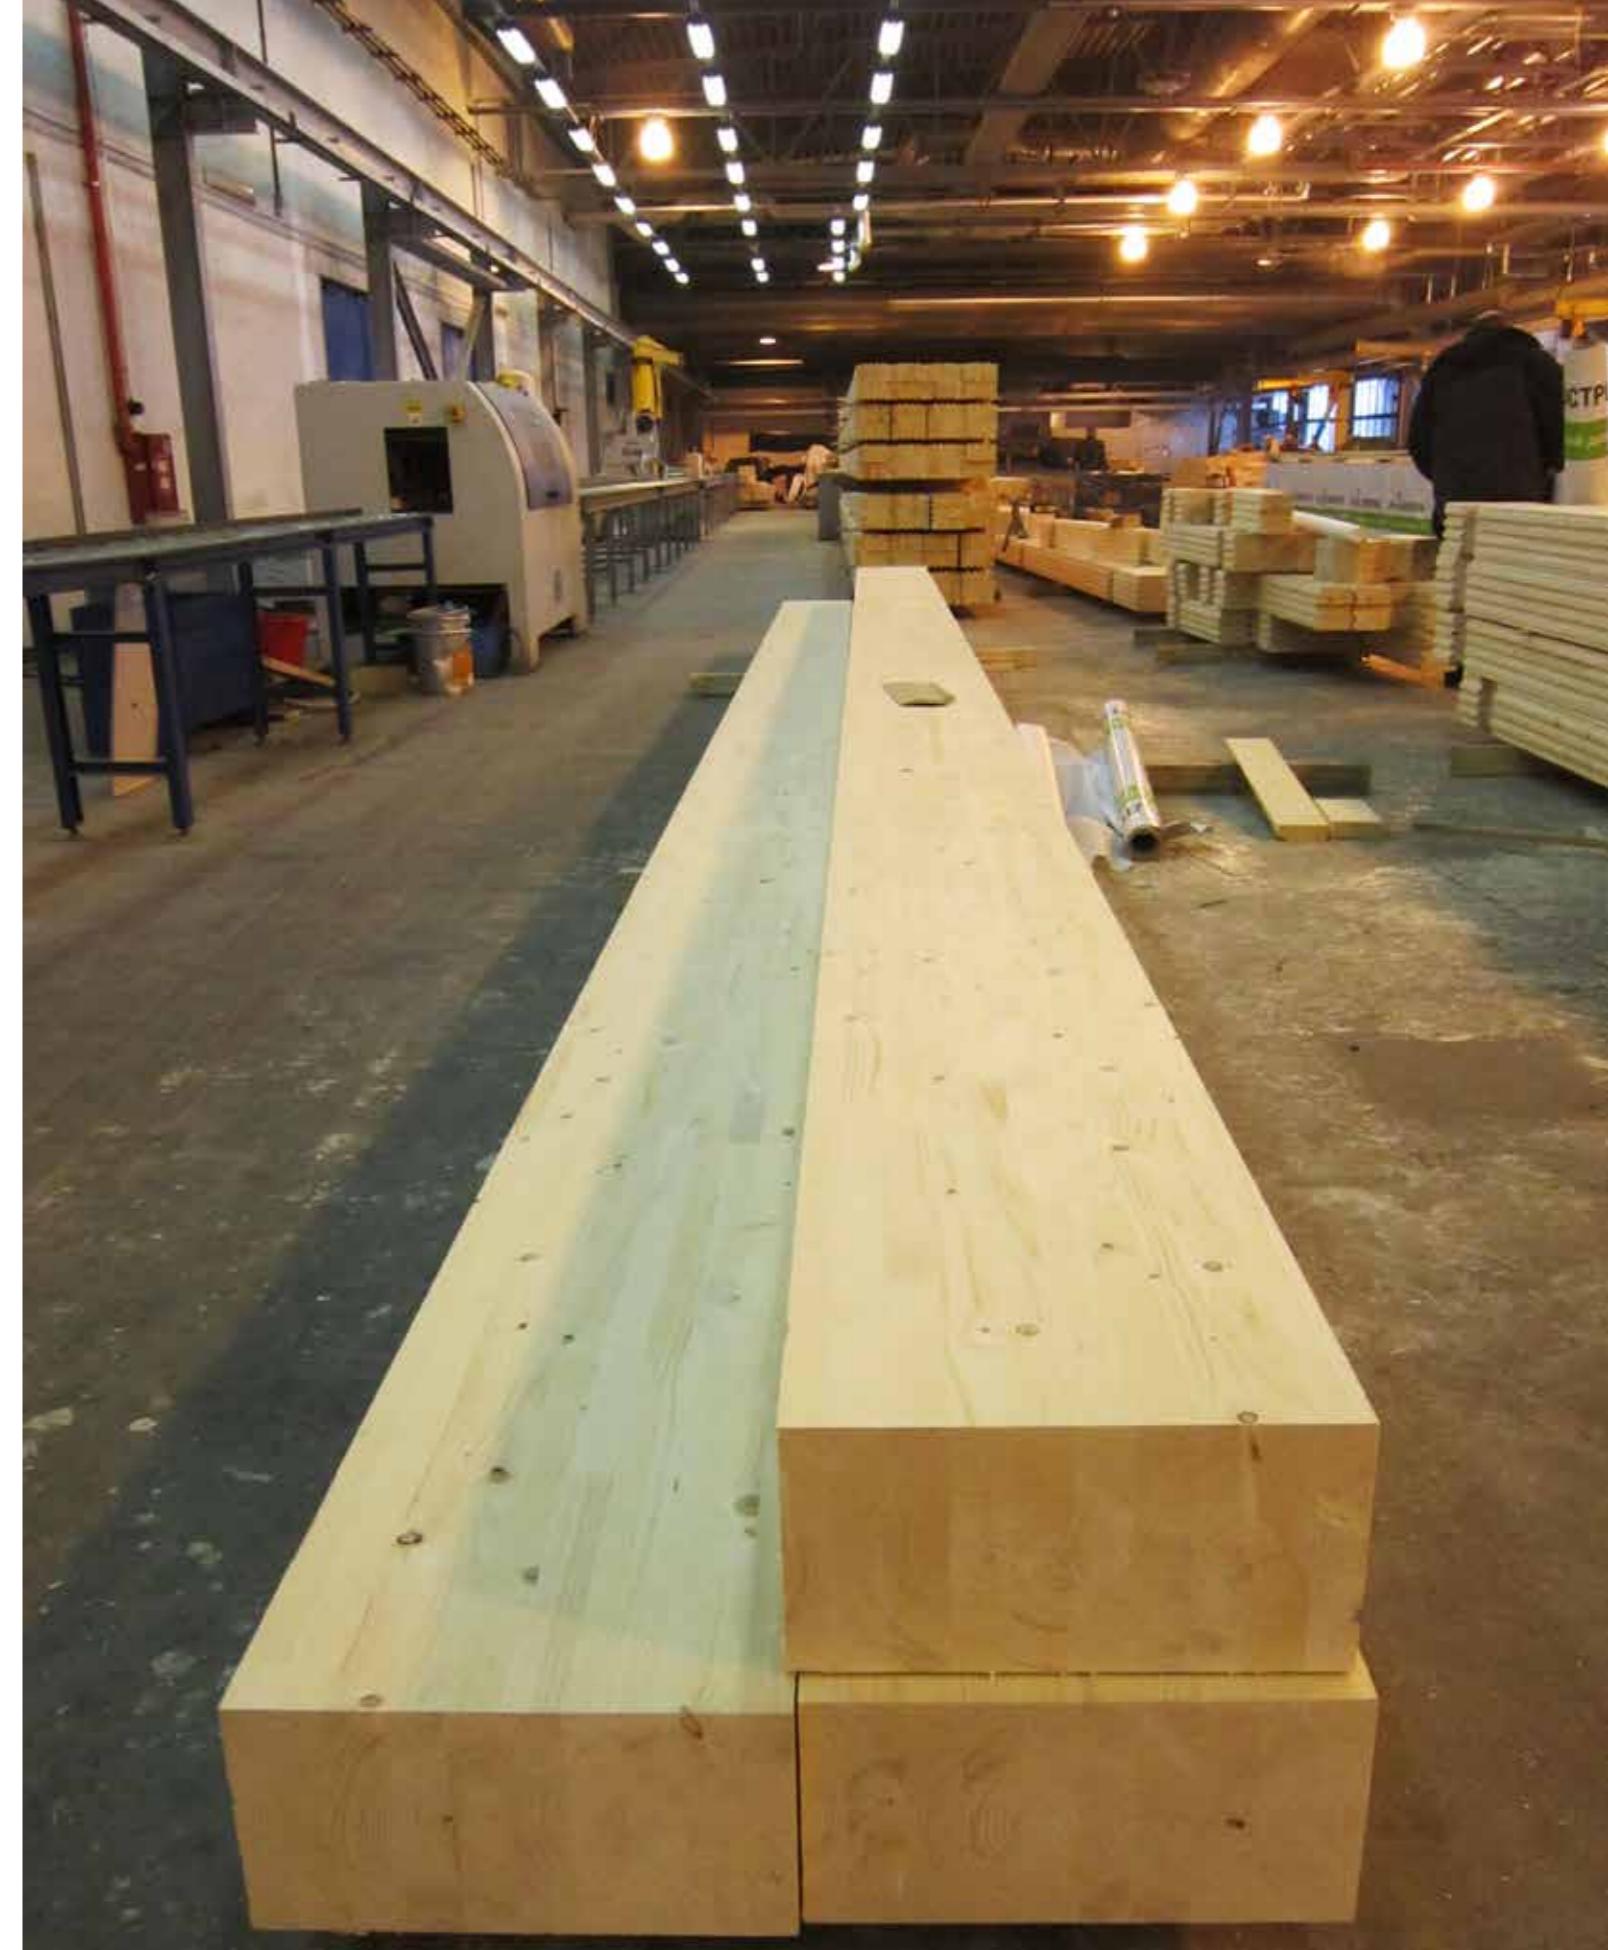

Market growth is possible with improvement of waste paper collection system in Russia

Growth of packaging cardboard consumption completely matching GDP growth
